Description

[BACKGROUND OF THE INVENTION]

Field of the Invention

[0001] The present invention relates to compounds having TGF β inhibitory activity and more particularly to quinoline derivatives and quinazoline derivatives having TGF β inhibitory activity. The present invention also relates to a pharmaceutical composition useful for the prophylaxis or therapy of diseases for which TGF β inhibition is effective therapeutically.

Background Art

[0002] TGF β (transforming growth factor- β) is a cytokine which is very important to organisms for regulating growth differentiation of cells and repair and regeneration of cells after tissue disorder. Disruption of its signal is known to cause onset and progression of various diseases.

[0003] The relationship between TGF β and fibrosis of organs or tissues is well known. The fibrosis of an organ or a tissue takes place as a result of excessive accumulation of extracellular matrix proteins within the organ for repair or as a defence mechanism upon damage to the organ or the like by some cause. The extracellular matrix proteins refer to a substance surrounding cells of the tissue. For example, fibrotic proteins such as collagen and elastin, glycoconjugates such as proteoglycan, and glycoproteins such as fibronectin and laminin is included as major extracellular matrix proteins.

[0004] When the level of fibrosis of an organ is low, the organ can be recovered to a normal state without leaving any scar. On the other hand, when the level of lesion of the organ is large or when the lesion continues, the fibrosis causes damage to the innate function of the organ. Further, the damage causes new fibrosis to create a vicious cycle. Ultimately, this causes organ failure and, in the worst case, sometimes leads to death.

[0005] TGF β is known to play an important role in the accumulation of the extracellular matrix proteins.

[0006] For example, the administration of TGF β to normal animals is known to cause fibrosis in various tissues (International Review of Experimental Pathology, 34B: 43-67, 1993). Further, fibrosis of tissues is also observed in the TGF β 1- highly expressing transgenic mice, and in the normal animals transduced TGF β 1 gene locally (Proc. Natl. Acad. Sci. USA, 92: 2572-2576, 1995; Laboratory Investigation, 74: 991-1003, 1995).

[0007] TGF β is considered to participate in the fibrosis of tissues through the following mechanism.

1) TGF β strongly induces mRNA expression of extracellular matrix proteins such as fibronectin (Journal of Biological Chemistry, 262: 6443-6446, 1987), collagen (Proc. Natl. Acad. Sci. USA, 85 1105-1108, 1988), and proteoglycan (Journal of Biological Chemistry, 263: 3039-3045, 1988) in cells.

2) TGF β lowers the expression of an extracellular degradative enzyme for extracellular matrix proteins (Journal of Biological Chemistry, 263: 16999-17005, 1988) and, in addition, highly promotes the expression of an inhibitor of the extracellular matrix degradative enzyme (Cancer Research, 49: 2553-2553, 1989). Consequently, the degradation of the extracellular matrix proteins is suppressed.

3) Further, TGF β increases the expression of integrin as a receptor of extracellular matrix proteins and promotes the deposition of the extracellular matrix proteins around cells (Journal of Biological Chemistry, 263: 4586-4592, 1988).

4) Furthermore, TGF β proliferates cells which produce extracellular matrix proteins, such as fibroblast cells (American Journal of Physiology, 264: F199-F205, 1993).

[0008] TGF β is known to be mainly involved in the fibrosis of organs such as kidney, liver, lung, heart, bone marrow, and skin.

[0009] For example, the analysis of expression of TGF β 1 clearly demonstrate an increase in expression of TGF β 1 in diseases such as human acute renal diseases, chronic renal diseases, diabetic nephropathy, renal allograft rejection, HIV nephropathy, hepatic fibrosis, cirrhosis, pulmonary fibrosis, scleroderma, and keloid (New Engl. J. Med., 331, 1286-1292, 1994), and the correlation between the TGF β 1 expression and the extracellular matrix protein expression.

[0010] Further, in pathologic animal models, such as renal failure diseases, diabetic nephropathy, hepatic fibrosis, pulmonary fibrosis, and scleroderma, it is reported that the administration of soluble receptor comprising the extracellular region of type II receptor and TGF β -neutralizing antibody can inhibit fibrosis and can improve the pathology (Nature, 346: 371-374, 1990; Journal of the British Thoracic Society, 54: 805-812, 1999; Journal of Immunology, 163: 5693-5699, 1999; Human Gene Therapy, 11: 33-42, 2000; Proc. Natl. Acad. Sci. USA, 97: 8015-20, 2000).

[0011] These facts show that the inhibition of TGF β is useful for the prophylaxis and therapy against all diseases

involving fibrosis including chronic renal diseases.

[0012] Further, TGF β is also involved in restenosis and arteriosclerosis.

[0013] In restenosis model animals, an increase in expression of TGF β 1 and its receptor is observed in a injured blood vessel, and TGF β 1 is suggested to be involved in the formation of new intima after balloon injury is suggested

(Clinical and Experimental Pharmacology and Physiology 23: 193-200, 1996).

[0014] In arteriosclerosis, a highly expression of TGF β 1 is observed in non-foam macrophage infiltrated in an affected region in which matrix proteins synthesis strongly takes place, (American Journal of Physiology 146: 1140-1149, 1995), suggesting that the non-foam macrophage participates in matrix protein synthesis in an arteriosclerosis affected region through TGF β 1.

[0015] Further, in a cell-migration test, TGF β 1 is also reported to be a potent stimulating factor for migration of smooth muscle cells causative of arteriosclerosis and vascular restenosis (Biochem Biophys Res Commun., 169: 725-729, 1990).

[0016] TGF β 1 is also involved in wound repair.

[0017] For example, an experiment using a neutralizing antibody against TGF β 1 demonstrates that the inhibition of TGF β 1 suppresses excessive scar after wound and is useful for functional recovery. Specifically, it is also known that the administration of a neutralizing antibody against TGF β 1 or TGF β 2 to rats can suppress scar and promotes dermal cell construction via a mechanism of the suppression of dermal fibronectin and collagen deposition and a reduction in the number of monocytes and macrophages (Journal of Cellular Science 108: 985-1002, 1995). In other tissues, the administration of anti-TGF β neutralizing antibody improves lesions in a rabbit corneal injury model and a rat gastric ulcer model (Cornea 16: 177-187, 1997; An international Journal of gastroenterology & Hepatology 39: 172-175, 1996).

[0018] Further, TGF β 1 is also known to be involved in peritoneal adhesion.

[0019] For example, it is suggested that the inhibition of TGF β is effective in suppressing peritoneal adhesion and subdermal fibrotic adhesion after surgery (J. Surg. Res., 65: 135-138, 1996).

[0020] A number of articles report that the administration of an anti-TGF β neutralizing antibody or a soluble type II TGF β receptor to cancer disease model animals has also beneficial effects on suppression of tumor growth and cancer metastasis (Journal of Clinical Investigation, 92: 2569-76, 1993; Clinical Cancer Research 7: 2931-2940, 2001; Cancer Res. 59: 2210-6, 1999; Journal of Clinical Investigation 109: 1551-1559, 2002; Journal of Clinical Investigation 109: 1607-1615, 2002).

[0021] Tumors usually acquire tumor growth capability and metastatic capability by inducing angiogenesis on host side and by lowering immunity of the host side through TGF β produced by the tumors per se. The suppression mechanism is based on the evidences that the administration of the anti-TGF β neutralizing antibody suppress the tumor growth capability and metastatic capability. Thus, the inhibition of TGF β is considered to be effective in suppressing cancer metastasis and cancer cell growth.

[0022] It is also reported that an anti-TGF β 1 neutralizing antibody is effective in in-vitro amplification of hematopoietic stem cells (Experimental Hematology 26: 374-381, 1998). Further, TGF β 1 has growth inhibitory activity against a large variety of cells. Accordingly, the inhibition of TGF β is expected to be effective in in-vitro amplification of a large variety of cells including hematopoietic stem cells.

[SUMMARY OF THE INVENTION]

[0023] The present inventors have now found that a certain group of quinoline derivatives and quinazoline derivatives have inhibitory activity against TGF β 1. The present invention has been made based on such finding.

[0024] It is an object of the present invention to provide a compound having potent TGF β inhibitory activity.

[0025] According to the present invention, there is provided a compound represented by formula (I) or a pharmaceutically acceptable salt or solvate thereof:

wherein

X represents CH or N,
 Z represents -O-, -NH-, -S-, or -C(=O)-,
 R and R', which may be the same or different, represent

- 1) a hydrogen atom,
- 2) a halogen atom,
- 3) C₁₋₆ alkyl optionally substituted by hydroxyl, a halogen atom, or a saturated or unsaturated five- or six-membered heterocyclic group,
- 4) C₂₋₆ alkenyl optionally substituted by an oxygen atom or C₁₋₄ alkoxy,
- 5) amino in which one or two hydrogen atoms on the amino group are optionally substituted by C₁₋₆ alkyl, and the C₁₋₆ alkyl group is optionally substituted by hydroxyl or a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group,
- 6) -C(=O)-NH₂ wherein one or two hydrogen atoms on the aminocarbonyl group are optionally substituted by C₁₋₆ alkyl,
- 7) -OR* wherein R* represents a hydrogen atom, or - (CH₂)_m-R^a wherein R^a represents a hydrogen atom, a halogen atom, hydroxyl, a saturated or unsaturated three- to six-membered carbocyclic or heterocyclic group, C₁₋₄ alkoxy, C₁₋₄ alkoxy carbonyl, or -NR^bR^c wherein R^b and R^c, which may be the same or different, represent a hydrogen atom or C₁₋₆ alkyl, in which the C₁₋₆ alkyl group is optionally substituted by hydroxyl, an oxygen atom, amino, a nitrogen atom, or C₁₋₄ alkyl, and R^b and R^c may combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or six-membered heterocyclic group, which may further comprise one or more heteroatoms, and in which the heterocyclic group is optionally substituted by C₁₋₄ alkyl, optionally substituted by hydroxyl, hydroxyl, an oxygen atom, aminocarbonyl, C₁₋₄ alkoxy, C₁₋₄ alkoxy carbonyl, or a saturated or unsaturated five- or six-membered heterocyclic group, and the heterocyclic group may condense with another saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group to form a bicyclic group; m is an integer of 1 to 6; and the alkyl chain part in this group, -(CH₂)_m-, is optionally substituted by hydroxyl, an oxygen atom, -OR^d group, wherein R^d represents C₁₋₄ alkyl or C₁₋₄ alkyl carbonyl, or C₁₋₄ alkyl optionally substituted by hydroxyl or a halogen atom, or
- 8) a saturated or unsaturated five- or six-membered heterocyclic group, and

[0026] A represents any group selected from the group consisting of formulae (a) to (c):

(a) a group of formula (a):

(a)

wherein

- R³ to R⁶, which may be the same or different, represent
- a hydrogen atom,
 - hydroxyl,
 - a halogen atom,
 - C₁₋₆ alkyl,
 - C₁₋₁₀ alkoxy optionally substituted by a halogen atom or phenyl,
 - C₂₋₆ alkenylcarbonyloxy,
 - C₁₋₄ alkylcarbonyl,
 - C₁₋₄ alkylthio, or
 - phenyl optionally substituted by a halogen atom,
- R³ and R⁴, R⁴ and R⁵, and R⁵ and R⁶ each may combine with a carbon atom attached thereto to form a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by a hydrogen atom, a halogen atom, hydroxyl, or C₁₋₄ alkyl,
- G represents

-C(=O)-R⁷,
 -CH₂-N(-R¹¹)R¹², or
 -C(-R¹³)(=NR¹⁴),

wherein

R⁷ represents

a hydrogen atom,

C₁₋₈ alkyl optionally substituted by C₁₋₄ alkoxy, an oxygen atom, or a saturated or unsaturated five- or six-membered carbocyclic group,

C₂₋₆ alkenyl optionally substituted by a saturated or unsaturated five- or six-membered carbocyclic group,

a saturated or unsaturated five- or six-membered carbocyclic group or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by hydroxyl, C₁₋₄ alkyl, or C₁₋₄ alkoxy, and the C₁₋₄ alkoxy group is optionally substituted by a halogen atom or a saturated or unsaturated five- or six-membered heterocyclic group,

group -O-R⁸, or

group -N(-R⁹)R¹⁰

wherein

R⁸ represents

C₁₋₁₀ alkyl optionally substituted by a saturated or unsaturated five- or six-membered carbocyclic group,

C₂₋₈ alkenyl, or

a saturated or unsaturated five- or six-membered carbocyclic group in which the carbocyclic group is optionally substituted by a halogen atom,

R⁹ and R¹⁰, and R¹¹ and R¹², which may be the same or different, each represent

a hydrogen atom,

C₁₋₆ alkyl,

a saturated or unsaturated five- or six-membered carbocyclic group in which the carbocyclic group is optionally substituted by a halogen atom, or

naphthyl optionally substituted by a halogen atom,

R⁹ and R¹⁰, or R¹¹ and R¹² may combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or six-membered heterocyclic group which may further comprise one or more heteroatoms and in which the heterocyclic group is optionally substituted by C₁₋₄ alkyl optionally substituted by hydroxyl, or a saturated or unsaturated five- or six-membered heterocyclic group,

R¹³ represents

a hydrogen atom or

C₁₋₄ alkyl,

R¹⁴ represents

a hydrogen atom, hydroxyl,

C₁₋₄ alkoxy optionally substituted by a saturated or unsaturated six-membered carbocyclic group,

C₂₋₆ alkenyloxy,

phenyloxy, or

amino optionally substituted by a saturated or unsaturated six-membered heterocyclic group,

(b) a group of formula (b):

(b)

wherein

any one of J, L, and M represents a nitrogen atom with the remaining two representing a carbon atom,

R¹⁵ to R¹⁹, which may be the same or different, represent

a hydrogen atom,
 a halogen atom,
 nitro,
 cyano,
 C₁₋₆ alkyl in which the alkyl group is optionally substituted by hydroxyl; phenyl; amino optionally substituted
 by C₁₋₄ alkyl; C₁₋₄ alkylcarbonyloxy; or a saturated or unsaturated six-membered heterocyclic group optionally
 substituted by C₁₋₄ alkyl,
 C₁₋₈ alkoxy,
 C₁₋₄ alkylcarbonyl,
 C₂₋₆ alkenyl optionally substituted by a saturated or unsaturated five- or six-membered carbocyclic group,
 C₂₋₆ alkynyl optionally substituted by C₁₋₄ alkylsilyl,
 C₁₋₄ alkylthio,
 a saturated or unsaturated three- to eight-membered carbocyclic oxy group,
 a saturated or unsaturated six-membered carbocyclic carbonyl or heterocyclic carbonyl group optionally sub-
 stituted by C₁₋₄ alkyl, or
 a saturated or unsaturated three- to eight-membered carbocyclic or heterocyclic group in which the carbo-
 cyclic or heterocyclic group is optionally substituted by hydroxyl; cyano; a halogen atom; C₁₋₄ alkoxy; phenyloxy;
 C₁₋₄ alkylcarbonyl; amino optionally substituted by C₁₋₄ alkyl or C₁₋₄ alkylcarbonyl; aminocarbonyl optionally sub-
 stituted by C₁₋₄ alkyl; or C₁₋₄ alkyl optionally substituted by hydroxyl or a halogen atom,
 R¹⁵ and R¹⁶, R¹⁶ and R¹⁷, R¹⁷ and R¹⁸, and R¹⁸ and R¹⁹ each may combine with a carbon atom attached
 thereto to form a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group, and the car-
 bocyclic or heterocyclic group is optionally substituted by C₁₋₄ alkyl,
 provided that, among R¹⁷ to R¹⁹, those in which J, L, or M attached thereto is a nitrogen atom are absent, and
 (c) a group of formula (c):

wherein
 R²⁰ to R²⁴, which may be the same or different, represent
 a hydrogen atom,
 a halogen atom,
 C₁₋₁₀ alkyl optionally substituted by hydroxyl, a saturated or unsaturated five- or six-membered carbocyclic
 or heterocyclic group,
 C₁₋₈ alkoxy,
 C₂₋₆ alkenyl optionally substituted by C₁₋₄ alkyl, C₁₋₄ alkoxy, an oxygen atom or phenyl,
 phenylcarbonyl optionally substituted by C₁₋₄ alkyl,
 amino optionally substituted by phenyl,
 nitro, or
 a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic
 or heterocyclic group is optionally substituted by C₁₋₆ alkyl,
 R²⁰ and R²¹, or R²³ and R²⁴ may combine with a carbon atom attached thereto to form a saturated or un-
 saturated five- or six-membered carbocyclic or heterocyclic group, and
 R²¹ and R²², or R²² and R²³ may combine with a carbon atom attached thereto to form a saturated or un-
 saturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group
 is optionally substituted by a halogen atom, C₁₋₄ alkyl, C₁₋₄ alkylcarbonyl, C₁₋₆ alkoxycarbonyl, or an oxygen atom,
 and the carbocyclic or heterocyclic group may condense with another saturated or unsaturated five- or six-mem-
 bered carbocyclic or heterocyclic group to form a tricyclic group together with the six-membered carbocyclic ring
 of formula (c).

[0027] In a preferred embodiment of the present invention, the compound according to the present invention is a compound represented by formula (II), or a pharmaceutically acceptable salt or solvate thereof:

wherein

X, Z, and A are as defined above,

R¹ and R², which may be the same or different, represent a hydrogen atom, or -(CH₂)_m-R^a wherein R^a represents a hydrogen atom, a halogen atom, hydroxyl, a saturated or unsaturated three- to six-membered carbocyclic or heterocyclic group, C₁₋₄ alkoxy, C₁₋₄ alkoxycarbonyl, or -NR^bR^c wherein R^b and R^c, which may be the same or different, represent a hydrogen atom or C₁₋₆ alkyl, in which the C₁₋₆ alkyl group is optionally substituted by hydroxyl, an oxygen atom, amino, a nitrogen atom, or C₁₋₄ alkyl, and R^b and R^c may combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or six-membered heterocyclic group, which may further comprise one or more heteroatoms, and in which the heterocyclic group is optionally substituted by C₁₋₄ alkyl, optionally substituted by hydroxyl, hydroxyl, an oxygen atom, aminocarbonyl, C₁₋₄ alkoxy, C₁₋₄ alkoxycarbonyl, or a saturated or unsaturated five- or six-membered heterocyclic group, and the heterocyclic group may condense with another saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group to form a bicyclic group; m is an integer of 1 to 6; and the alkyl chain part in this group, -(CH₂)_m-, is optionally substituted by hydroxyl, an oxygen atom, -OR^d group, wherein R^d represents C₁₋₄ alkyl or C₁₋₄ alkylcarbonyl, or C₁₋₄ alkyl optionally substituted by hydroxyl or a halogen atom.

[0028] The compound according to the present invention can be used for the therapy or prophylaxis of diseases for which TGFβ inhibition is effective therapeutically or prophylactically.

[0029] Diseases for which TGFβ inhibition is effective therapeutically or prophylactically include, for example, chronic renal disease, acute renal disease, hepatic fibrosis, cirrhosis, fibroid lung, scleroderma, wound healing, arthritis, congestive cardiac disease, ulcer, ocular disorder, cornea disorder, diabetic nephropathy, peritoneal sclerosis, arterial sclerosis, peritoneal adhesion, and subdermal adhesion and, further, malignant tumors. Accordingly, the compound according to the present invention is useful for the prophylaxis or therapy of such diseases. The compound according to the present invention is also useful for in-vitro amplification of hematopoietic stem cells.

[0030] The pharmaceutical composition according to the present invention comprises as an active ingredient the compound represented by formula (I) according to the present invention.

[0031] The TGFβ inhibitor according to the present invention comprises the compound according to the present invention.

[0032] The method for treating or preventing a disease for which TGFβ inhibition is effective therapeutically or prophylactically according to the present invention comprises the step of administering a therapeutically or prophylactically effective amount of the compound represented by formula (I) according to the present invention or a pharmaceutically acceptable salt or solvate thereof to a patient who should undergo therapy of a disease for which TGFβ inhibition is effective therapeutically or prophylactically.

[0033] The method for amplifying cells in vitro according to the present invention comprises the step of administering, to target cells in vitro, the compound represented by formula (I) according to the present invention or a pharmaceutically acceptable salt or solvate thereof in an amount effective for promoting cell amplification to amplify cells.

[DETAILED DESCRIPTION OF THE INVENTION]

Compound of formula (I)

[0034] The terms "alkyl," "alkoxy," "alkenyl," and "alkynyl" as used herein as a group or a part of a group respectively mean straight chain or branched chain alkyl, alkoxy, alkenyl, and alkynyl.

[0035] The terms "alkylcarbonyl," "alkylsilyl," "alkylthio," "alkoxycarbonyl," "alkenylcarbonyloxy," and "alkenylloxy" as used herein as a group or a part of a group respectively mean straight chain or branched chain alkylcarbonyl, alkylsilyl, alkylthio, alkoxycarbonyl, alkenylcarbonyloxy, and alkenylloxy.

[0036] Accordingly, for example, the "C₁₋₁₀ alkyl" and "C₁₋₁₀ alkoxy" as used herein as a group or a part of a group respectively mean straight chain or branched chain alkyl and alkoxy having 1 to 10 carbon atoms.

[0037] "C₁₋₁₀ alkyl" is preferably C₁₋₈ alkyl, more preferably C₁₋₆ alkyl, still more preferably C₁₋₄ alkyl. "C₁₋₈ alkyl" is preferably C₁₋₆ alkyl, more preferably C₁₋₄ alkyl. "C₁₋₆ alkyl" is preferably C₁₋₄ alkyl, more preferably C₁₋₂ alkyl. "C₁₋₄ alkyl" is preferably C₁₋₂ alkyl.

[0038] "C₁₋₁₀ alkoxy" is preferably C₁₋₈ alkoxy, more preferably C₁₋₆ alkoxy, still more preferably C₁₋₄ alkoxy. "C₁₋₈ alkoxy" is preferably C₁₋₆ alkoxy, more preferably C₁₋₄ alkoxy. "C₁₋₄ alkoxy" is preferably C₁₋₂ alkoxy.

[0039] "C₂₋₈ alkenyl" is preferably C₂₋₆ alkenyl, more preferably C₂₋₄ alkenyl. "C₂₋₆ alkenyl" is preferably C₂₋₄ alkenyl. "C₂₋₄ alkenyl" is preferably C₂ or C₃ alkenyl, more preferably C₂ alkenyl.

[0040] "C₂₋₆ alkynyl" is preferably C₂₋₄ alkynyl.

[0041] "C₁₋₄ alkylcarbonyl" is preferably C₁₋₂ alkylcarbonyl.

[0042] "C₁₋₄ alkylsilyl" is preferably C₁₋₂ alkylsilyl.

[0043] "C₁₋₄ alkylthio" is preferably C₁₋₂ alkylthio.

[0044] "C₁₋₆ alkoxycarbonyl" is preferably C₁₋₄ alkoxycarbonyl, more preferably C₁₋₂ alkoxycarbonyl.

[0045] "C₂₋₆ alkenylcarbonyloxy" is preferably C₂₋₄ alkenylcarbonyloxy.

[0046] "C₂₋₆ alkenyloxy" is preferably C₂₋₄ alkenyloxy.

[0047] Examples of C₁₋₁₀ alkyl include methyl, ethyl, n-propyl, isopropyl, n-butyl, i-butyl, s-butyl, t-butyl, n-pentyl, n-hexyl, n-heptyl, n-octyl, n-nonyl, and n-decyl.

[0048] Examples of C₁₋₁₀ alkoxy include methoxy, ethoxy, n-propoxy, i-propoxy, n-butoxy, i-butoxy, s-butoxy, and t-butoxy.

[0049] Examples of C₂₋₆ alkenyl include allyl, butenyl, pentenyl, and hexenyl.

[0050] Examples of C₂₋₆ alkynyl include 2-propynyl, butynyl, pentynyl, and hexynyl.

[0051] Examples of C₁₋₄ alkylcarbonyl include aldehyde, methylcarbonyl, ethylcarbonyl, n-propylcarbonyl, isopropylcarbonyl, n-butylcarbonyl, i-butylcarbonyl, and s-butylcarbonyl.

[0052] Examples of C₁₋₄ alkylsilyl include methylsilyl, ethylsilyl, n-propylsilyl, isopropylsilyl, n-butylsilyl, i-butylsilyl, and s-butylsilyl.

[0053] Examples of C₁₋₄ alkylthio include methylthio, ethylthio, n-propylthio, isopropylthio, n-butylthio, i-butylthio, and s-butylthio.

[0054] Examples of C₁₋₆ alkoxycarbonyl include methoxycarbonyl, ethoxycarbonyl, n-propoxycarbonyl, i-propoxycarbonyl, n-butoxycarbonyl, i-butoxycarbonyl, s-butoxycarbonyl, and t-butoxycarbonyl.

[0055] Examples of C₂₋₆ alkenylcarbonyloxy include allylcarbonyloxy, butenylcarbonyloxy, pentenylcarbonyloxy, and hexenylcarbonyloxy.

[0056] Examples of C₂₋₆ alkenyloxy include allyloxy, butenyloxy, pentenyloxy, and hexenyloxy.

[0057] The expression alkyl "optionally substituted by" as used herein refers to alkyl, in which one or more hydrogen atoms on the alkyl group have been substituted by one or more substituents which may be the same or different, and unsubstituted alkyl. It will be apparent to a person having ordinary skill in the art that the maximum number of substituents may be determined depending upon the number of substitutable hydrogen atoms on the alkyl group. This is true of groups, which may be substituted, other than the alkyl group, for example, alkylsilyl, alkylloxycarbonyl, alkoxy, alkenyl, alkynyl, phenyl, phenylcarbonyl, naphthyl and the like.

[0058] The term "halogen atom" as used herein means a fluorine, chlorine, bromine, or iodine atom.

[0059] The terms "unsaturated carbocyclic ring" and "unsaturated heterocyclic ring" as used herein respectively mean carbocyclic and heterocyclic rings having one or more unsaturated bonds such as a double bond.

[0060] The "saturated or unsaturated three- to eight-membered carbocyclic ring" is preferably a four- to seven-membered, more preferably five- or six-membered, saturated or unsaturated carbocyclic ring. Examples of saturated or unsaturated three- to eight-membered carbocyclic rings include phenyl, cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, and cycloheptyl.

[0061] The "saturated or unsaturated three- to eight-membered heterocyclic ring" contains at least one hetero-atom selected from oxygen, nitrogen, and sulfur atoms. The saturated or unsaturated three- to eight-membered heterocyclic ring preferably contains one, two or three hetero-atoms with the remaining ring-constituting atoms being carbon atoms. The saturated or unsaturated three- to eight-membered heterocyclic ring is preferably a saturated or unsaturated four- to seven-membered heterocyclic ring, more preferably a saturated or unsaturated five- or six-membered heterocyclic ring. Examples of saturated or unsaturated three- to eight-membered heterocyclic groups include thienyl, pyridyl, 1,2,3-triazolyl, thiazolyl, imidazolyl, isoxazolyl, pyrazolyl, piperazinyl, piperazino, piperidyl, piperidino, morpholinyl, morpholino, homopiperazinyl, homopiperazino, thiomorpholinyl, thiomorpholino, tetrahydropyrrolyl, and azepanyl.

[0062] The saturated or unsaturated carboxylic and heterocyclic groups may condense with another saturated or unsaturated five- to seven-membered carbocyclic or heterocyclic ring to form a bicyclic group, preferably a saturated or unsaturated nine- to twelve-membered bicyclic carbocyclic or heterocyclic group. Such bicyclic groups include naphthyl, quinolyl, 1,2,3,4-tetrahydroquinolyl, 1,4-benzoxanyl, indanyl, indolyl, 1,2,3,4-tetrahydronaphthyl, and phthalimide.

[0063] When the carbocyclic or heterocyclic group is substituted by two C₁₋₆ alkyl groups, the two alkyl groups may combine together to form an alkylene chain, preferably a C₁₋₃ alkylene chain. Carbocyclic or heterocyclic groups having this crosslinked structure include azabicyclo[2.2.2]octanyl, bicyclo[2.2.2]octanyl and norbornanyl.

[0064] The "saturated or unsaturated five- to six-membered carbocyclic group" as used herein preferably has a six-membered saturated or unsaturated carbocyclic ring. Examples of saturated or unsaturated five- or six-membered carbocyclic rings include phenyl, cyclopentyl, and cyclohexyl.

[0065] The "saturated or unsaturated five- or six-membered heterocyclic group" as used herein refers to a saturated or unsaturated five- or six-membered monocyclic heterocyclic group. That is, the saturated or unsaturated five- or six-membered heterocyclic ring may be a heterocyclic ring that contains one to three, preferably one or two hetero-atoms with the remaining ring-constituting atoms being carbon atoms. The heterocyclic group contains at least one hetero-atom selected from oxygen, nitrogen, and sulfur atoms. Examples of heterocyclic groups include pyridyl, furyl, thienyl, pyrrolyl, pyridazyl, pyrimidyl, morpholinyl, morpholino, isoxazolyl, oxazolyl, thiazolyl, imidazolyl, isothiazolyl, and pyrazyl.

[0066] This heterocyclic group is optionally substituted by C₁₋₆ alkyl; C₁₋₄ alkyl optionally substituted by hydroxyl; or a saturated or unsaturated five- or six-membered heterocyclic group, so far as there is no particular description on the substituent.

[0067] The "saturated or unsaturated six-membered carbocyclic oxy group" as used herein include phenyloxy and cyclohexyloxy.

[0068] The "saturated or unsaturated five- or six-membered carbocyclic carbonyl group" as used herein preferably has a saturated or unsaturated six-membered carbocyclic ring. Examples of saturated or unsaturated five- or six-membered carbocyclic carbonyl groups include phenylcarbonyl, cyclopentylcarbonyl, and cyclohexylcarbonyl.

[0069] The "saturated or unsaturated five- or six-membered heterocyclic carbonyl group" as used herein refers to a carbonyl group containing a saturated or unsaturated five- or six-membered monocyclic heterocyclic group. That is, the heterocyclic group part in the saturated or unsaturated five- or six-membered heterocyclic carbonyl group may be a heterocyclic ring that contains one to three, preferably one or two hetero-atoms with the remaining ring-constituting atoms being carbon atoms. The heterocyclic group contains at least one hetero-atom selected from oxygen, nitrogen, and sulfur atoms. Examples of heterocyclic carbonyl groups include pyridylcarbonyl, furylcarbonyl, thienylcarbonyl, pyrrolylcarbonyl, pyridazylcarbonyl, pyrimidylcarbonyl, morpholinylcarbonyl, morpholinocarbonyl, isoxazolylcarbonyl, oxazolylcarbonyl, thiazolylcarbonyl, imidazolylcarbonyl, isothiazolylcarbonyl, and pyrazylcarbonyl.

[0070] In one preferred embodiment of the present invention, at least one of R and R' is selected from the group consisting of

- 1) a hydrogen atom,
- 2) a halogen atom,
- 3) C₁₋₆ alkyl optionally substituted by hydroxyl, a halogen atom, or a saturated or unsaturated five- or six-membered heterocyclic group,
- 4) C₂₋₆ alkenyl optionally substituted by an oxygen atom or C₁₋₄ alkoxy,
- 5) amino in which one or two hydrogen atoms on the amino group are optionally substituted by C₁₋₆ alkyl, and the C₁₋₆ alkyl group is optionally substituted by hydroxyl or a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group,
- 6) -C(=O)-NH₂ wherein one or two hydrogen atoms on the aminocarbonyl group are optionally substituted by C₁₋₆ alkyl, or
- 8) a saturated or unsaturated five- or six-membered heterocyclic group.

[0071] In a more preferred embodiment of the present invention, at least one of R and R' is selected from the group consisting of

- a hydrogen atom,
- a halogen atom,
- C₁₋₄ alkyl optionally substituted by hydroxyl, a halogen atom, or a saturated or unsaturated five- or six-membered heterocyclic group,
- C_{2,4} alkenyl optionally substituted by an oxygen atom or C₁₋₄ alkoxy,
- amino in which one or two hydrogen atoms on the amino group are optionally substituted by C_{1,4} alkyl, and the C_{1,4} alkyl group is optionally substituted by hydroxyl or a saturated or unsaturated five- or six-membered heterocyclic group,
- C(=O)-NH₂, and
- a saturated or unsaturated five- or six-membered heterocyclic group.

[0072] In a still more preferred embodiment of the present invention, R' is selected from the group consisting of a hydrogen atom,

a halogen atom,
 C₁₋₄ alkyl optionally substituted by hydroxyl, a halogen atom, or a saturated or unsaturated five- or six-membered heterocyclic group,

C₂₋₄ alkenyl optionally substituted by an oxygen atom or C₁₋₄ alkoxy,
 amino in which one or two hydrogen atoms on the amino group are optionally substituted by C₁₋₄ alkyl, and the C₁₋₄ alkyl group is optionally substituted by hydroxyl or a saturated or unsaturated five- or six-membered heterocyclic group,

-C(=O)-NH₂, and

a saturated or unsaturated five- or six-membered heterocyclic group.

[0073] In another more preferred embodiment of the present invention, at least one of R and R' is selected from the group consisting of

a hydrogen atom,

a halogen atom,

C₁₋₄ alkyl optionally substituted by hydroxyl, a halogen atom, or a saturated six-membered heterocyclic group,

C₂₋₄ alkenyl optionally substituted by an oxygen atom or C₁₋₄ alkoxy,

amino in which one of the hydrogen atoms on the amino group is optionally substituted by C₁₋₄ alkyl, and the C₁₋₄ alkyl group is optionally substituted by a saturated six-membered heterocyclic group, and
 an unsaturated six-membered heterocyclic group.

[0074] In another preferred embodiment of the present invention, R is represented by -OR¹, and R' is represented by -OR². In this case, R¹ and R², which may be the same or different, represent a hydrogen atom, or -(CH₂)_m-R^a wherein R^a represents a hydrogen atom, a halogen atom, hydroxyl, a saturated or unsaturated three- to six-membered carbocyclic or heterocyclic group, C₁₋₄ alkoxy, C₁₋₄ alkoxycarbonyl, or -NR^bR^c wherein R^b and R^c, which may be the same or different, represent a hydrogen atom or C₁₋₆ alkyl, in which the C₁₋₆ alkyl group may be substituted by hydroxyl, an oxygen atom, amino, a nitrogen atom, or C₁₋₄ alkyl, and R^b and R^c may combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or six-membered heterocyclic group, which may further comprise one or more heteroatoms, and in which the heterocyclic group is optionally substituted by C₁₋₄ alkyl optionally substituted by hydroxyl, hydroxyl, an oxygen atom, aminocarbonyl, C₁₋₄ alkoxy, C₁₋₄ alkoxycarbonyl, or a saturated or unsaturated five- or six-membered heterocyclic group, and the heterocyclic group may condense with another saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group to form a bicyclic group; m is an integer of 1 to 6; and the alkyl chain part in this group, -(CH₂)_m-, is optionally substituted by hydroxyl, an oxygen atom, -OR^d group, wherein R^d represents C₁₋₄ alkyl or C₁₋₄ alkylcarbonyl, or C₁₋₄ alkyl optionally substituted by hydroxyl or a halogen atom.

[0075] Specifically, in a preferred embodiment of the present invention, the compound represented by formula (I) is represented by formula (II).

[0076] In R^a in R^a, R¹ or R², the "saturated or unsaturated three- to six-membered carbocyclic group" is preferably a saturated or unsaturated six-membered carbocyclic group.

[0077] In R^a in R^a, R¹ or R², the "saturated or unsaturated three- to six-membered heterocyclic group" contains at least one heteroatom selected from oxygen, nitrogen, and sulfur atoms, preferably an oxygen or nitrogen atom. Preferably, the saturated or unsaturated three- to six-membered heterocyclic group may be a heterocyclic group which contains one or two heteroatoms with the remaining ring atoms being a carbon atom.

[0078] In still another preferred embodiment of the present invention, R¹ and R² represent a hydrogen atom, or -(CH₂)_m-R^a wherein R^a represents a hydrogen atom, a halogen atom, hydroxyl, a saturated or unsaturated three- to six-membered carbocyclic or heterocyclic group, or -NR^bR^c wherein R^b and R^c, which may be the same or different, represent a hydrogen atom or C₁₋₆ alkyl optionally substituted by hydroxyl, and R^b and R^c may combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or six-membered heterocyclic group, which may further comprise one or more heteroatoms, and in which the heterocyclic group is optionally substituted by C₁₋₄ alkyl optionally substituted by hydroxyl, or a saturated or unsaturated five- or six-membered heterocyclic group; m is an integer of 1 to 5; and the alkyl chain part in this group, -(CH₂)_m-, is optionally substituted by hydroxyl, an oxygen atom, or -OR^d group, wherein R^d represents C₁₋₄ alkyl or C₁₋₄ alkylcarbonyl.

[0079] In a preferred embodiment of the present invention, R¹ and R², which may be the same or different, represent any group selected from the group consisting of
 a hydrogen atom,
 C₁₋₆ alkyl optionally substituted by phenyl, and
 groups of formulae (i) to (vi):

(i) a group of formula (i):

wherein

10 R⁵¹ and R⁵², which may be the same or different, represent
a hydrogen atom, or

C₁₋₈ alkyl optionally substituted by hydroxyl, an oxygen atom, amino, or a nitrogen atom,

15 R⁵¹ and R⁵² may combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or
six-membered heterocyclic group which may further comprise one or more heteroatoms and in which the hetero-
cyclic group is optionally substituted by C₁₋₄ alkyl optionally substituted by hydroxyl, hydroxyl, an oxygen atom,
aminocarbonyl, C₁₋₄ alkoxy, C₁₋₄ alkoxycarbonyl, or a saturated or unsaturated five- or six-membered heterocyclic
group, and the heterocyclic group optionally formed by allowing R⁵¹ to combine with R⁵² may condense with
another saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group to form a bicyclic group,

p is an integer of 2 to 4, preferably 2 or 3, and

20 the alkyl chain part in this group is optionally substituted by hydroxyl, or -OR^e group wherein R^e represents
C₁₋₄ alkyl or C₁₋₄ alkylcarbonyl,

(ii) a group of formula (ii):

30 wherein q is an integer of 1 to 4, preferably 1 or 2,

(iii) a group of formula (iii):

wherein Hal represents a halogen atom, preferably a fluorine or chlorine atom, and

40 r represents an integer of 2 to 4, preferably 2 or 3,

(iv) a group of formula (iv):

50 wherein

R⁵³ and R⁵⁴, which may be the same or different, represent
a hydrogen atom, or

C₁₋₆ alkyl optionally substituted by hydroxyl,

55 R⁵³ and R⁵⁴ may combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or
six-membered heterocyclic group which may further comprise one or more heteroatoms and in which the hetero-
cyclic group is optionally substituted by C₁₋₄ alkyl, optionally substituted by hydroxyl, or a saturated or unsaturated
five- or six-membered heterocyclic group, and the heterocyclic group optionally formed by allowing R⁵³ to combine
with R⁵⁴ may condense with another saturated or unsaturated five- or six-membered carbocyclic or heterocyclic

group to form a bicyclic group, and
 s is an integer of 0 to 3, preferably 0 to 2,
 (v) a group of formula (v):

wherein
 R⁵⁵ represents C₁₋₄ alkyl and
 t is an integer of 0 (zero) to 3, preferably 0 to 2, and
 (vi) a group of formula (vi):

wherein
 R⁵⁶, R⁵⁷ and R⁵⁸, which may be the same or different, represent
 a hydrogen atom,
 C₁₋₄ alkoxycarbonyl, or
 C₁₋₄ alkyl optionally substituted by hydroxyl or a halogen atom, and
 u is an integer of 0 (zero) to 4, preferably 0 to 2, more preferably 0 or 1.

[0080] In a more preferred embodiment of the present invention, formula (i) is represented by formula (i-a):

[0081] In a still more preferred embodiment of the present invention, R¹ and R², which may be the same or different, represent

any group selected from the group consisting of
 a hydrogen atom,
 C₁₋₆ alkyl,
 benzyl,
 groups of formulae (i), (v), and (vi), and
 groups of formulae (ii-a), (iii-a), and (iv-a):

formula (ii-a):

formula (iii-a):

(iii-a)

wherein r_1 is an integer of 2 to 4, preferably 2 or 3, and
formula (iv-a):

(iv-a).

[0082] In a still more preferred embodiment of the present invention, one of R^1 and R^2 is selected from C_{1-6} alkyl, and the other substituent is selected from the group consisting of

a hydrogen atom,

benzyl, and

groups of formulae (i), (ii-a), (iii-a), (iv-a), (v), and (vi).

[0083] When at least one of R^1 and R^2 represents a group of formula (i), R^{51} and R^{52} , which may be the same or different, preferably represent

a hydrogen atom, or

C_{1-4} alkyl optionally substituted by hydroxyl, an oxygen atom, amino, or a nitrogen atom,

R^{51} and R^{52} may combine with a nitrogen atom attached thereto to form a heterocyclic group such as pyridyl, pyrrolyl, pyridazyl, 2-piperidyl, piperidino, piperazyl, pyrimidyl, morpholinyl, morpholino, imidazolyl, or pyrazyl, and the heterocyclic group is optionally substituted by C_{1-4} alkyl optionally substituted by hydroxyl, hydroxyl, an oxygen atom, aminocarbonyl, C_{1-4} alkoxy, C_{1-4} alkoxy carbonyl, or a saturated five- or six-membered heterocyclic group. Further, the heterocyclic group formed by allowing R^{51} to combine with R^{52} may condense with another saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group to form a bicyclic group.

[0084] When at least one of R^1 and R^2 represents a group of formula (i-a), R^{51} and R^{52} , which may be the same or different, preferably represent

a hydrogen atom, or

C_{1-2} alkyl optionally substituted by hydroxyl, or

R^{51} and R^{52} may combine with a nitrogen atom attached thereto to form a heterocyclic group such as 2-piperidyl, piperidino, piperazyl, morpholinyl, morpholino, or imidazolyl. This heterocyclic group is optionally substituted by methyl optionally substituted by hydroxyl, or is optionally substituted by pyrrolidyl or piperidino.

[0085] When at least one of R^1 and R^2 represents a group of formula (iv-a), R^{53} and R^{54} preferably combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or six-membered heterocyclic group, in which the heterocyclic group may further contain one or more heteroatoms, more preferably form morpholine.

[0086] When at least one of R^1 and R^2 represents a group of formula (v), R^{55} preferably represents methyl or ethyl.

[0087] When at least one of R^1 and R^2 represents a group of formula (vi), R^{56} , R^{57} , and R^{58} , which may be the same or different, preferably represent a hydrogen atom, C_{1-2} alkoxy carbonyl, or C_{1-4} alkyl optionally substituted by hydroxyl. When any of R^{56} , R^{57} , and R^{58} represents C_{1-4} alkyl, the alkyl group is optionally substituted by one or two hydroxyl groups.

[0088] In a preferred embodiment of the present invention, at least one of R^1 and R^2 represents C_{1-6} alkyl. More preferably, R^1 represents C_{1-6} alkyl.

[0089] When at least one of R^1 and R^2 represents C_{1-6} alkyl, the C_{1-6} alkyl group preferably represents C_{1-4} alkyl, more preferably methyl or ethyl, most preferably methyl.

[0090] In formula (I), the group of formula (a), which A may represent, is preferably represented by any group selected from the group consisting of formulae (a1) to (a3):

(1) a group of formula (a1):

(a1)

wherein

R³, R⁴ and R⁶, which may be the same or different, represent
a hydrogen atom,

a halogen atom,

C₁₋₆ alkyl,

C₁₋₁₀ alkoxy optionally substituted by a halogen atom or phenyl,

C₂₋₆ alkenylcarbonyloxy,

C₁₋₄ alkylcarbonyl, or

phenyl optionally substituted by a halogen atom,

R⁵ is as defined in formula (a), that is,

a hydrogen atom,

hydroxyl,

a halogen atom,

C₁₋₆ alkyl,

C₁₋₁₀ alkoxy optionally substituted by a halogen atom or phenyl,

C₂₋₆ alkenylcarbonyloxy,

C₁₋₄ alkylcarbonyl,

C₁₋₄ alkylthio, or

phenyl optionally substituted by a halogen atom,

R³ and R⁴, R⁴ and R⁵, and R⁵ and R⁶ each may combine with a carbon atom attached thereto to form a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group,

R⁷ is as defined in formula (a),

(2) a group of formula (a2):

(a2)

wherein wherein R³ to R⁶ are as defined in formula (a1),

R¹¹ and R¹² are as defined in formula (a), and

(3) a group of formula (a3):

15 wherein

R^{3a} to R^{6a}, which may be the same or different, represent
 a hydrogen atom,
 a halogen atom, or
 C₁₋₆ alkyl, and
 R¹³ and R¹⁴ are as defined in formula (a).

20 When A represents a group of formula (a1) and R³ and R⁴, R⁴ and R⁵, or R⁵ and R⁶ in formula (a1) form a carbocyclic or heterocyclic group, a cyclic group may be formed at a position of any one of a combination of R³ with R⁴, a combination of R⁴ with R⁵, or a combination of R⁵ with R⁶. Alternatively, a cyclic group may be formed at two or more positions of R³ and R⁴, R⁴ and R⁵, and R⁵ and R⁶. In this case, A may combine with the carbocyclic ring of formula (a1) to form a tricyclic group.

25 When A represents the group of formula (a1), R³, R⁴ and R⁶ in formula (a1), which may be the same or different, preferably represent

a hydrogen atom,
 a halogen atom,
 C₁₋₄ alkyl, or
 C₁₋₄ alkoxy optionally substituted by a halogen atom or phenyl.

R⁵ in formula (a1) preferably represents

a hydrogen atom,
 hydroxyl,
 a halogen atom,
 C₁₋₄ alkyl,
 C₁₋₄ alkoxy optionally substituted by a halogen atom or phenyl,
 C₂₋₄ alkenylcarbonyloxy,
 C₁₋₂ alkylcarbonyl,
 C₁₋₂ alkylthio, or
 phenyl optionally substituted by a halogen atom.

30 In a more preferred embodiment of the present invention, R⁵ may be represented by -OR⁷³ wherein R⁷³ represents a hydrogen atom, or C₁₋₄ alkyl optionally substituted by phenyl.

35 In another preferred embodiment of the present invention, R⁵ is selected from groups other than a hydrogen atom.

40 In one preferred embodiment of the present invention, at least one of R³ to R⁶ in formula (a1) is selected from group other than a hydrogen atom.

In another one preferred embodiment of the present invention, R⁴ combines with R⁵ to form phenyl as follows, and this phenyl combines with phenyl in formula (a1) to form a bicyclic group.

wherein R^{74} to R^{77} represent a hydrogen atom, a halogen atom, hydroxyl, or C_{1-4} alkyl, preferably a hydrogen atom.

In one preferred embodiment of the present invention, R^7 in formula (a1) represents a hydrogen atom, C_{1-4} alkyl, or phenyl in which the phenyl group is optionally substituted by hydroxyl, C_{1-4} alkyl, or C_{1-4} alkoxy. More preferably, R^7 represents a hydrogen atom, methyl, ethyl, or phenyl, and the phenyl group is optionally substituted by hydroxyl, C_{1-4} alkyl, or C_{1-4} alkoxy. In this case, more preferably, R^5 is selected from groups other than a hydrogen atom.

In another preferred embodiment of the present invention, R^7 in formula (a1) represents group $-O-R^8$ or group $-N(-R^9)R^{10}$.

When R^7 in formula (a1) represents group $-O-R^8$, R^8 preferably represents unsubstituted C_{1-8} alkyl; C_{1-4} alkyl substituted by phenyl; C_{2-8} alkenyl; or phenyl optionally substituted by a halogen atom. More preferably, R^8 represents unsubstituted C_{1-8} alkyl; methyl substituted by phenyl; C_{2-8} alkenyl; or phenyl. In this case, more preferably, R^5 is selected from groups other than a hydrogen atom.

When R^7 in formula (a1) represents group $-N(-R^9)R^{10}$, preferably, at least one of R^9 and R^{10} represents a hydrogen atom and the other substituent represents

a hydrogen atom,

C_{1-6} alkyl,

a saturated or unsaturated five- or six-membered carbocyclic group in which the carbocyclic group is optionally substituted by a halogen atom, or

naphthyl optionally substituted by a halogen atom, or

R^9 and R^{10} combine with a nitrogen atom attached thereto to form a saturated five- or six-membered heterocyclic group in which the heterocyclic group may further comprise at least one heteroatom. More preferably, at least one of R^9 and R^{10} represents a hydrogen atom, and

the other substituent represents a hydrogen atom, C_{1-4} alkyl, a saturated or unsaturated six-membered carbocyclic group in which the carbocyclic group is optionally substituted by a halogen atom, or naphthyl, or

R^9 and R^{10} combine with a nitrogen atom attached thereto to form a saturated six-membered heterocyclic group in which the heterocyclic group may further comprise at least one heteroatom. In this case, more preferably, R^5 is selected from groups other than a hydrogen atom.

When A represents the group of formula (a2), preferably, R^{11} and R^{12} in formula (a2) combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or six-membered heterocyclic group in which the heterocyclic group may further comprise one or more heteroatoms and is optionally substituted by C_{1-4} alkyl optionally substituted by hydroxyl; or a saturated five- or six-membered heterocyclic group. In this case, preferably, R^3 , R^4 , and R^6 in formula (a2) represent a hydrogen atom, hydroxyl, or a halogen atom, and R^5 in formula (a2) represents C_{1-4} alkyl.

More preferably, R^{11} and R^{12} combine with a nitrogen atom attached thereto to form a saturated five- or six-membered heterocyclic group in which the heterocyclic group may further comprise one or more heteroatoms. Still more preferably, R^{11} and R^{12} combine with a nitrogen atom attached thereto to form piperidino, 2-piperidyl, or morpholino.

When A represents the group of formula (a3), preferably, R^{13} represents C_{1-4} alkyl, more preferably methyl or ethyl, still more preferably methyl.

R^{14} in formula (a3) preferably represents hydroxyl; C_{1-4} alkoxy optionally substituted by phenyl; C_{2-6} alkenyloxy; phenyloxy; or amino optionally substituted by a six-membered unsaturated heterocyclic group. In this case, more preferably, R^{13} represents methyl.

Preferably, R^{3a} and R^{6a} in formula (a3) represent a hydrogen atom, and R^{4a} and R^{5a} represent C_{1-6} alkyl. More preferably, R^{3a} and R^{6a} represent a hydrogen atom, and R^{4a} and R^{5a} represent methyl.

In formula (I), the group of formula (b), which A may represent, is preferably any group selected from the group

consisting of formulae (b1) to (b3):

(4) a group of formula (b1):

15 wherein

R²⁵ to R²⁷, which may be the same or different, represent a hydrogen atom,

a halogen atom,

C₁₋₆ alkyl,

C₁₋₈ alkoxy,

C₁₋₄ alkylcarbonyl,

C₁₋₄ alkylthio, or

phenylcarbonyl,

R²⁵ and R²⁶, and R²⁶ and R²⁷ each may combine with a carbon atom attached thereto to form a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group,

R²⁸ represents

a hydrogen atom,

a halogen atom,

nitro,

cyano,

C₁₋₆ alkyl in which the alkyl group is optionally substituted by hydroxyl; phenyl; amino optionally substituted by C₁₋₄ alkyl; C₁₋₄ alkylcarbonyloxy; or a saturated or unsaturated six-membered heterocyclic group optionally substituted by C₁₋₄ alkyl,

C₁₋₈ alkoxy,

C₁₋₄ alkylcarbonyl,

C₂₋₆ alkenyl optionally substituted by a saturated or unsaturated six-membered carbocyclic group,

C₂₋₆ alkynyl optionally substituted by C₁₋₂ alkylsilyl,

a saturated or unsaturated three- to eight-membered carbocyclic oxy group,

a saturated or unsaturated six-membered carbocyclic carbonyl or heterocyclic carbonyl group optionally substituted by C₁₋₄ alkyl, or

a saturated or unsaturated three- to eight-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by hydroxyl; cyano; a halogen atom; C₁₋₄ alkoxy; phenyloxy; C₁₋₄ alkylcarbonyl; amino optionally substituted by C₁₋₄ alkyl or C₁₋₄ alkylcarbonyl; aminocarbonyl optionally substituted by C₁₋₄ alkyl; or C₁₋₄ alkyl optionally substituted by hydroxyl or a halogen atom,

(5) a group of formula (b2):

wherein

R²⁹ to R³², which may be the same or different, represent

a hydrogen atom,

a halogen atom, or

C₁₋₆ alkyl optionally substituted by hydroxyl,

R²⁹ and R³⁰, and R³¹ and R³² each may combine with a carbon atom attached thereto to form a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by a halogen atom or C₁₋₄ alkyl, and

(6) a group of formula (b3):

wherein

R³³ to R³⁶, which may be the same or different, represent a hydrogen atom,

a halogen atom, or

C₁₋₆ alkyl optionally substituted by hydroxyl,

R³³ and R³⁴, R³⁴ and R³⁵, and R³⁵ and R³⁶ each may combine with a carbon atom attached thereto to form a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by a halogen atom or C₁₋₄ alkyl.

[0091] When A represents the group of formula (b1), R²⁵ in formula (b1) preferably represents a hydrogen atom or a halogen atom, more preferably a hydrogen atom.

[0092] R²⁶ in formula (b1) preferably represents a hydrogen atom, a halogen atom, or C₁₋₄ alkyl, more preferably a hydrogen atom, a halogen atom, methyl, or ethyl.

[0093] R²⁷ in formula (b1) preferably represents a hydrogen atom, a halogen atom, C₁₋₄ alkyl, C₁₋₄ alkoxy, or C₁₋₄ alkylthio, more preferably a halogen atom, methyl, ethyl, or methoxy.

[0094] In one more preferred embodiment of the present invention,

R²⁵ represents a hydrogen atom,

R²⁶ represents a hydrogen atom, a halogen atom, or C₁₋₄ alkyl, and

R²⁷ represents a hydrogen atom, a halogen atom, C₁₋₄ alkyl, C₁₋₄ alkoxy, or C₁₋₄ alkylthio.

[0095] In one still more preferred embodiment of the present invention, R²⁵ represents a hydrogen atom, R²⁶ represents methyl, and R²⁷ represents methyl.

[0096] In another preferred embodiment of the present invention, R²⁶ and R²⁷ combine with a carbon atom attached thereto to form an unsaturated six-membered carbocyclic or heterocyclic group. In this case, formula (b1) may be represented by formula.

wherein R²⁵ is as defined above,

R⁷¹ represents methyl, ethyl, phenyl, or optionally substituted 2-pyridyl,

R⁸⁶ to R⁸⁹ represent a hydrogen atom, a halogen atom, or C₁₋₄ alkyl, and, preferably, all of R⁸⁶ to R⁸⁹ represent a hydrogen atom, and

all of Es represent a carbon atom, or alternatively, any one of Es represents a nitrogen atom with the remaining Es representing a carbon atom.

[0097] In the above formula, preferably, all of Es represent a carbon atom, or alternatively, any of Es connected directly to R⁸⁶ or R⁸⁸ represents a nitrogen atom with the remaining Es representing a carbon atom.

R²⁸ in formula (b1) preferably represents

a hydrogen atom,

a halogen atom,

nitro,

cyano,

C₁₋₆ alkyl in which the alkyl group is optionally substituted by hydroxyl; phenyl; amino optionally substituted by C₁₋₄ alkyl; C₁₋₄ alkylcarbonyloxy; or a saturated or unsaturated six-membered heterocyclic group optionally substituted by C₁₋₄ alkyl,

C₁₋₄ alkoxy,

C₁₋₄ alkylcarbonyl,

C₂₋₆ alkenyl optionally substituted by phenyl,

C₂₋₆ alkynyl optionally substituted by C₁₋₂ alkylsilyl,

a saturated or unsaturated three- to eight-membered carbocyclic oxy group,

an unsaturated six-membered heterocyclic carbonyl group optionally substituted by C₁₋₄ alkyl,

phenylcarbonyl, or

a saturated or unsaturated three- to eight-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by hydroxyl; cyano; a halogen atom; C₁₋₄ alkoxy; phenyloxy; C₁₋₄ alkylcarbonyl; amino optionally substituted by C₁₋₄ alkyl or C₁₋₄ alkylcarbonyl; aminocarbonyl optionally substituted by C₁₋₄ alkyl; or C₁₋₄ alkyl optionally substituted by hydroxyl or a halogen atom.

[0098] Here when R²⁸ represents alkylcarbonyl, carbocyclic carbonyl, or heterocyclic carbonyl group, R²⁸ may be represented by -C(=O)R⁷¹. In this case, R⁷¹ represents methyl, ethyl, phenyl, or optionally substituted 2-pyridyl.

[0099] When R²⁸ represents alkyl substituted by alkylcarbonyloxy, R²⁸ may be represented by -C(-R⁷¹)OR⁷² wherein R⁷¹ is as defined above and R⁷² represents a hydrogen atom or methylcarbonyl.

[0100] When R²⁸ represents a carbocyclic oxy group, R²⁸ may be represented by -OR⁸⁰ wherein R⁸⁰ preferably represents cyclopentyl, cyclohexyl, or phenyl.

[0101] When R²⁸ represents alkyl substituted by amino, R²⁸ may be represented by -CH₂-N(-R⁸⁴)R⁸⁵ wherein R⁸⁴ and R⁸⁵ represent C₁₋₄ alkyl, preferably methyl, ethyl, propyl, i-propyl, butyl, t-butyl, or 1-butyl.

[0102] In a more preferred embodiment of the present invention, R²⁸ represents a saturated or unsaturated three- to eight-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by hydroxyl; cyano; a halogen atom; C₁₋₄ alkoxy; phenyloxy; C₁₋₄ alkylcarbonyl; amino optionally substituted by C₁₋₄ alkyl or C₁₋₄ alkylcarbonyl; aminocarbonyl optionally substituted by C₁₋₄ alkyl; or C₁₋₄ alkyl optionally substituted by hydroxyl or a halogen atom.

[0103] In a more preferred embodiment of the present invention, R²⁸ represents a saturated or unsaturated four- to seven-membered carbocyclic or heterocyclic group, still more preferably a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group, particularly preferably pyridyl, furyl, thienyl, pyrrolyl, pyridazyl, pyrimidyl, isoxazolyl, isothiazolyl, thiazolyl, or pyrazyl. These rings are optionally substituted.

[0104] In another one more preferred embodiment of the present invention,

R²⁵ represents a hydrogen atom,

R²⁶ represents a hydrogen atom, a halogen atom, or C₁₋₄ alkyl,

R²⁷ represents a hydrogen atom, a halogen atom, C₁₋₄ alkyl, C₁₋₄ alkoxy, or C₁₋₄ alkylthio,

R²⁶ and R²⁷ may combine with a carbon atom attached thereto to form an unsaturated six-membered carbocyclic or heterocyclic group, and, more preferably, in this case,

R²⁸ represents a saturated or unsaturated four- to seven-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by hydroxyl; cyano; a halogen atom; C₁₋₄ alkoxy; phenyloxy; C₁₋₄ alkylcarbonyl; amino optionally substituted by C₁₋₄ alkyl or C₁₋₄ alkylcarbonyl; aminocarbonyl optionally substituted by C₁₋₄ alkyl; or C₁₋₄ alkyl optionally substituted by hydroxyl or a halogen atom.

[0105] When A represents the group of formula (b2), R²⁹ in formula (b2) preferably represents a hydrogen atom.

R³⁰ in formula (b2) preferably represents a hydrogen atom or C₁₋₄ alkyl.

[0106] R³¹ and R³² in formula (b2) preferably combine with carbon atom attached thereto to form an unsaturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by a halogen atom or C₁₋₄ alkyl. More preferably, R³¹ combines with R³² to form a phenyl ring or a thienyl ring.

[0107] When A represents the group of formula (b3), R³³ and R³⁴ in formula (b3) preferably represent a hydrogen atom, a halogen atom, methyl, or ethyl, more preferably a hydrogen atom.

[0108] R³⁵ and R³⁶ in formula (b3) combine with a carbon atom attached thereto to preferably form an unsaturated five- or six-membered carbocyclic or heterocyclic group, more preferably phenyl.

[0109] When A represents the group of formula (c), at least one of R²⁰ and R²⁴ in formula (c) is preferably selected from a group other than a hydrogen atom.

[0110] In formula (c), preferably, R²¹ and R²², or R²² and R²³ combine with a carbon atom attached thereto to form a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group. The carbocyclic or heterocyclic group is optionally substituted by a halogen atom, C₁₋₄ alkyl, C₁₋₄ alkylcarbonyl, C₁₋₆ alkoxy, or an oxygen atom and may condense with another saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group to form, together with the six-membered carbocyclic ring in formula (c), a tricyclic group. In this case, preferably, any one of or both R²⁰ and R²⁴ is selected from groups other than a hydrogen atom.

[0111] In another preferred embodiment of the present invention, R²² represents

[0112] C₁₋₁₀ alkyl optionally substituted by hydroxyl or a saturated or unsaturated six-membered carbocyclic or heterocyclic group,

C₁₋₈ alkoxy,

amino optionally substituted by phenyl,

nitro, or

a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by C₁₋₆ alkyl. In this case, any one of or both R²⁰ and R²⁴ is selected from groups other than a hydrogen atom.

[0113] When R²⁰ or R²⁴ is optionally substituted C₂₋₆ alkenyl, preferably, R²⁰ or R²⁴ may be represented by -C=C(R⁶¹)(R⁶²) wherein R⁶¹ and R⁶², which may be the same or different, represent a hydrogen atom, C₁₋₄ alkyl, C₁₋₄ alkoxy, C₁₋₄ alkoxy, or phenyl. More preferably, R⁶¹ and R⁶² represent a hydrogen atom, C₁₋₂ alkoxy, or phenyl.

[0114] When R²⁰ or R²⁴ is amino optionally substituted by phenyl, preferably, R²⁰ or R²⁴ is represented by formula

wherein

R⁶³ to R⁶⁷, which may be the same or different, represent a hydrogen atom, hydroxyl, a halogen atom, or C₁₋₄ alkyl.

[0115] When R²¹ and R²², or R²² and R²³ combine with a carbon atom attached thereto to form a carbocyclic or heterocyclic group, the formed ring combines with the carbocyclic ring of formula (c) to form a bicyclic group. Examples of such bicyclic groups include groups such as naphthyl, indole, benzimidazole, quinoline, isoquinoline, and quinazoline.

[0116] For example, when the bicyclic group is in the form of an indole ring, formula (c) may be represented by formula

wherein

R²⁰ and R²⁴ are as defined above,

R⁶⁸ to R⁷⁰, which may be the same or different, represent a hydrogen atom, a halogen atom, C₁₋₂ alkylcarbonyl, C₁₋₂ alkoxy, or C₁₋₄ alkyl, and, preferably, R⁶⁹ represents a hydrogen atom.

[0117] When the bicyclic group is in the form of an isoquinoline ring, formula (c) may be represented by formula

wherein

R²⁰, R²³ and R²⁴ are as defined above,

R⁹⁰ to R⁹², which may be the same or different, represent a hydrogen atom, a halogen atom, C₁₋₂ alkylcarbonyl, C₁₋₂ alkoxy carbonyl, or C₁₋₄ alkyl.

[0118] When the bicyclic group is in the form of a quinazoline ring, formula (c) may be represented by formula

wherein

R²⁰, R²³ and R²⁴ are as defined above,

R⁹³ represents a hydrogen atom, a halogen atom, C₁₋₂ alkylcarbonyl, C₁₋₂ alkoxy carbonyl, or C₁₋₄ alkyl, and, preferably, R⁹³ represents a hydrogen atom.

[0119] In a preferred embodiment of the present invention, A is selected from the group of formula (a) and the group of formula (b).

[0120] In one preferred embodiment of the present invention, when one of R¹ and R² is selected from C₁₋₆ alkyl with the other substituent being selected from the group consisting of a hydrogen atom, benzyl, and groups of formulae (i), (ii-a), (iii-a), (iv-a), (v), and (vi), A is selected from the group of formula (a1) or the group of formula (b1). In this case, preferably, X represents CH and Z represents -O-.

[0121] When A represents the group of formula (a1) and R⁷ represents a hydrogen atom, C₁₋₄ alkyl, or phenyl in which the phenyl group is optionally substituted by hydroxyl, C₁₋₄ alkyl, or C₁₋₄ alkoxy, preferably, X represents CH or N and Z represents -O-.

[0122] When A represents the group of formula (a1) with R⁷ representing group -O-R⁸, preferably, X represents CH and Z represents -O-, -S-, or -C(=O)-.

[0123] When A represents the group of formula (a1) with R⁷ representing group -N(-R⁹)R¹⁰, preferably, X represents CH and Z represents -O-.

[0124] When A represents the group of formula (a2) or formula (a3) with both R¹ and R² being selected from C₁₋₆ alkyl, preferably, X represents CH and Z represents -O-.

[0125] When A represents the group of formula (b1) with both R¹ and R² being selected from C₁₋₆ alkyl, preferably, X represents CH and Z represents -O- or -NH-.

[0126] When A represents the group of formula (b2) with both R¹ and R² being selected from C₁₋₆ alkyl, preferably, X represents CH and Z represents -O-.

[0127] When A represents the group of formula (b3) with both R¹ and R² being selected from C₁₋₆ alkyl, preferably, X represents CH and Z represents -O- or -S-.

[0128] When A represents the group of formula (c), preferably, R¹ and R², which may be the same or different, are selected from C₁₋₆ alkyl. In this case, preferably, X represents CH and Z represents -O-.

[0129] In a preferred embodiment of the present invention,

when X represents CH and Z represents -O-, A is selected from the groups of formulae (a) to (c),

when X represents CH and Z represents -NH-, A represents the group of formula (a3),

when X represents CH and Z represents -C(=O)-, A represents the group of formula (a1),

when X represents CH and Z represents -S-, A represents the group of formula (a1) or formula (b3), or

when X represents N and Z represents -O-, A represents the group of formula (a1) or formula (b1).

[0130] In one preferred embodiment of the present invention, the compound represented by formula (I) may be a compound represented by formula (100):

wherein

X represents CH or N,

Z represents -O-, -NH-, -S-, or -C(=O)-,

R¹⁰¹ and R¹⁰², which may be the same or different, represent any group selected from the group consisting of a hydrogen atom,

C₁₋₆ alkyl,

benzyl, and groups of formulae (i), (ii-a), (iii-a), (iv-a), (v), and (vi),

R¹⁰³, R¹⁰⁴ and R¹⁰⁶, which may be the same or different, represent

a hydrogen atom,

a halogen atom,

C₁₋₆ alkyl,

C₁₋₁₀ alkoxy optionally substituted by a halogen atom or phenyl,

C₂₋₆ alkenylcarbonyloxy,

C₁₋₄ alkylcarbonyl, or

phenyl optionally substituted by a halogen atom,

R¹⁰⁵ represents

hydroxyl,

a halogen atom,

C₁₋₆ alkyl,

C₁₋₁₀ alkoxy optionally substituted by a halogen atom or phenyl,

C₂₋₆ alkenylcarbonyloxy,

C₁₋₄ alkylcarbonyl,

C₁₋₄ alkylthio, or

phenyl optionally substituted by a halogen atom,

R¹⁰³ and R¹⁰⁴, R¹⁰⁴ and R¹⁰⁵, and R¹⁰⁵ and R¹⁰⁶ each may combine with a carbon atom attached thereto to form a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group,

R¹⁰⁷ represents

a hydrogen atom,

C₁₋₄ alkyl, or

phenyl optionally substituted by hydroxyl, C₁₋₄ alkyl, or C₁₋₄ alkoxy.

[0131] In one more preferred embodiment of the present invention, in formula (100),

at least one of R¹⁰¹ and R¹⁰² represents methyl, and

R¹⁰⁷ represents a hydrogen atom, methyl, ethyl, or phenyl optionally substituted by hydroxyl, C₁₋₄ alkyl or C₁₋₄ alkoxy. In this case, preferably, Z represents -O-.

[0132] Specific examples of compounds represented by formula (100) include compounds 26 to 76, 118 to 162, 172 to 192, 200, and 312 to 321.

[0133] In one preferred embodiment of the present invention, the compound represented by formula (I) may be a compound represented by formula (200):

wherein

X represents CH or N,

Z represents -O-, -NH-, -S-, or -C(=O)-,

R²⁰¹ and R²⁰², which may be the same or different, represent any group selected from the group consisting of a hydrogen atom,

C₁₋₆ alkyl,

benzyl, and

groups of formulae (i), (ii-a), (iii-a), (iv-a), (v), and (vi),

R²⁰³ to R²⁰⁶, which may be the same or different, represent

a hydrogen atom,

hydroxyl,

a halogen atom,

C₁₋₆ alkyl,

C₁₋₁₀ alkoxy optionally substituted by a halogen atom or phenyl,

C₂₋₆ alkenylcarbonyloxy,

C₁₋₄ alkylcarbonyl,

C₁₋₄ alkylthio, or

phenyl optionally substituted by a halogen atom,

R²⁰³ and R²⁰⁴, R²⁰⁴ and R²⁰⁵, and R²⁰⁵ and R²⁰⁶ each may combine with a carbon atom attached thereto to form a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group,

provided that at least one of R²⁰³ to R²⁰⁶ is selected from a group other than a hydrogen atom, and

R²⁰⁸ represents unsubstituted C₁₋₈ alkyl; C₁₋₄ alkyl substituted by phenyl; C₂₋₈ alkenyl; or phenyl optionally substituted by a halogen atom.

[0134] In one more preferred embodiment of the present invention, in formula (200),

R²⁰⁸ represents unsubstituted C₁₋₈ alkyl; methyl substituted by phenyl; C₂₋₈ alkenyl; or phenyl. In this case, preferably, Z represents -O-, S-, or -C(=O)-.

[0135] Specific examples of compounds represented by formula (200) include compounds 79 to 103, 163, 201, 322 to 327, and 419.

[0136] In one preferred embodiment of the present invention, the compounds represented by formula (I) may be compounds represented by formula (300):

wherein

X represents CH or N,

Z represents -O-, -NH-, -S-, or -C(=O)-,

R³⁰¹ and R³⁰², which may be the same or different, represent any group selected from the group consisting of

a hydrogen atom,

C₁₋₆ alkyl,

benzyl, and

groups of formulae (i), (ii-a), (iii-a), (iv-a), (v), and (vi),

R³⁰³ to R³⁰⁶, which may be the same or different, represent

a hydrogen atom,

hydroxyl,

a halogen atom,

C₁₋₆ alkyl,

C₁₋₁₀ alkoxy optionally substituted by a halogen atom or phenyl,

C₂₋₆ alkenylcarbonyloxy,

C₁₋₄ alkylcarbonyl,

C₁₋₄ alkylthio, or

phenyl optionally substituted by a halogen atom,

R³⁰³ and R³⁰⁴, R³⁰⁴ and R³⁰⁵, and R³⁰⁵ and R³⁰⁶ each may combine with a carbon atom attached thereto to

form a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group,

provided that at least one of R³⁰³ to R³⁰⁶ is selected from a group other than a hydrogen atom, and

at least one of R³⁰⁹ and R³¹⁰ represents a hydrogen atom and the other substituent represents

a hydrogen atom,

C₁₋₆ alkyl,

a saturated or unsaturated five- or six-membered carbocyclic group in which the carbocyclic group is optionally substituted by a halogen atom, or

naphthyl optionally substituted by a halogen atom, or

R³⁰⁹ and R³¹⁰ combine with a nitrogen atom attached thereto to form a saturated five- or six-membered heterocyclic group which may further comprise one or more heteroatoms.

[0137] In one more preferred embodiment of the present invention, in formula (300),

at least one of R³⁰⁹ and R³¹⁰ represents a hydrogen atom and

the other substituent represents a hydrogen atom, C₁₋₄ alkyl, a saturated or unsaturated six-membered carbocyclic group in which the carbocyclic group is optionally substituted by a halogen atom, or naphthyl, or

R³⁰⁹ and R³¹⁰ combine with a nitrogen atom attached thereto to form a saturated six-membered heterocyclic group which may further comprise one or more heteroatoms. In this case, preferably, Z represents -O-.

[0138] Specific examples of compounds represented by formula (300) include compounds 104 to 114.

[0139] In one preferred embodiment of the present invention, the compound represented by formula (I) may be a compound represented by formula (400):

wherein

X represents CH or N,

Z represents -O-, -NH-, -S-, or -C(=O)-,

R⁴⁰¹ and R⁴⁰², which may be the same or different, represent any group selected from C₁₋₆ alkyl,

R⁴⁰³, R⁴⁰⁴, and R⁴⁰⁶ represent a hydrogen atom, hydroxyl, or a halogen atom,

R⁴⁰⁵ represents C₁₋₄ alkyl,

R⁴¹¹ and R⁴¹² combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or six-membered heterocyclic group in which the heterocyclic group may further comprise one or more heteroatoms and is optionally substituted by C₁₋₄ alkyl optionally substituted by hydroxyl; or a saturated five- or six-membered heterocyclic group.

[0140] In one more preferred embodiment of the present invention, in formula (400),

R⁴⁰¹ and R⁴⁰² represent methyl,

R⁴¹¹ and R⁴¹² combine with a nitrogen atom attached thereto to form a saturated five- or six-membered heterocyclic group in which the heterocyclic group may further comprise one or more heteroatoms. In this case, preferably, Z represents -O-.

[0141] Specific examples of compounds represented by formula (400) include compound 6.

[0142] In one preferred embodiment of the present invention, the compound represented by formula (I) may be a compound represented by formula (500):

wherein

X represents CH or N,

Z represents -O-, -NH-, -S-, or -C(=O)-,

R⁵⁰¹ and R⁵⁰², which may be the same or different, represent any group selected from C₁₋₆ alkyl,

R⁵⁰³ and R⁵⁰⁶ represent a hydrogen atom,

R⁵⁰⁴ and R⁵⁰⁵ represent C₁₋₆ alkyl,

R⁵¹³ represents C₁₋₄ alkyl, and

R⁵¹⁴ represents hydroxyl; C₁₋₄ alkoxy optionally substituted by phenyl; C₂₋₆ alkenyloxy; phenyloxy; or amino

optionally substituted by a six-membered unsaturated heterocyclic group.

[0143] In one more preferred embodiment of the present invention, in formula (500),

R⁵⁰¹ and R⁵⁰² represent methyl,

R⁵⁰³ and R⁵⁰⁶ represent a hydrogen atom,

R⁵⁰⁴ and R⁵⁰⁵ represent methyl, and

[0144] R⁵¹³ represents methyl. In this case, preferably, Z represents -O-.

[0145] Specific examples of compounds represented by formula (500) include compounds 193 to 199.

[0146] In one preferred embodiment of the present invention, the compound represented by formula (I) may be a compound represented by formula (600):

wherein

X represents CH or N,

Z represents -O-, -NH-, -S-, or -C(=O)-,

R⁶⁰¹ and R⁶⁰², which may be the same or different, represent any group selected from the group consisting of a hydrogen atom,

C₁₋₆ alkyl,

benzyl, and

groups of formulae (i), (ii-a), (iii-a), (iv-a), (v), and (vi),

R⁶²⁵ represents a hydrogen atom,

R⁶²⁶ represents a hydrogen atom, a halogen atom, or C₁₋₄ alkyl,

R⁶²⁷ represents a hydrogen atom, a halogen atom, C₁₋₄ alkyl, C₁₋₄ alkoxy, or C₁₋₄ alkylthio,

R⁶²⁶ and R⁶²⁷ may combine with a carbon atom attached thereto to form an unsaturated six-membered carbocyclic or heterocyclic group,

R⁶²⁸ represents

a hydrogen atom,

a halogen atom,

nitro,

cyano,

C₁₋₆ alkyl in which the alkyl group is optionally substituted by hydroxyl; phenyl; amino optionally substituted by C₁₋₄ alkyl; C₁₋₄ alkylcarbonyloxy; or a saturated or unsaturated six-membered heterocyclic group optionally substituted by C₁₋₄ alkyl,

C₁₋₈ alkoxy,

C₁₋₄ alkylcarbonyl,

C₂₋₆ alkenyl optionally substituted by a saturated or unsaturated six-membered carbocyclic group,

C₂₋₆ alkynyl optionally substituted by C₁₋₂ alkylsilyl,

a saturated or unsaturated three- to eight-membered carbocyclic oxy group,

a saturated or unsaturated six-membered carbocyclic carbonyl or heterocyclic carbonyl group optionally substituted by C₁₋₄ alkyl, or

a saturated or unsaturated three- to eight-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by hydroxyl; cyano; a halogen atom; C₁₋₄ alkoxy; phenoxy; C₁₋₄ alkylcarbonyl; amino optionally substituted by C₁₋₄ alkyl or C₁₋₄ alkylcarbonyl; aminocarbonyl optionally substituted by C₁₋₄ alkyl; or C₁₋₄ alkyl optionally substituted by hydroxyl or a halogen atom.

[0147] In one more preferred embodiment of the present invention, in formula (600),

R^{628} represents a saturated or unsaturated four- to seven-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by hydroxyl; cyano; a halogen atom; C_{1-4} alkoxy; phenyloxy; C_{1-4} alkylcarbonyl; amino optionally substituted by C_{1-4} alkyl or C_{1-4} alkylcarbonyl; aminocarbonyl optionally substituted by C_{1-4} alkyl; or C_{1-4} alkyl optionally substituted by hydroxyl or a halogen atom. In this case, preferably, Z represents -O- or -NH-.

[0148] Specific examples of compounds represented by formula (600) include compounds 115 to 117, 202 to 292, 310, 311, 328 to 409, 415 to 418, 421 to 424, and 426 to 469.

[0149] In one preferred embodiment of the present invention, the compound represented by formula (I) may be a compound represented by formula (700):

wherein

X represents CH or N,

Z represents -O-, -NH-, -S-, or -C(=O)-,

R^{701} and R^{702} , which may be the same or different, represent any group selected from C_{1-6} alkyl,

R^{729} represents a hydrogen atom,

R^{730} represents a hydrogen atom or C_{1-4} alkyl, and

R^{731} and R^{732} combine with a carbon atom attached thereto to form an unsaturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by a halogen atom or C_{1-4} alkyl.

[0150] In one more preferred embodiment of the present invention, in formula (700),

R^{701} and R^{702} represent methyl. In this case, preferably, Z represents -O-.

[0151] Specific examples of compounds represented by formula (700) include compounds 307 to 309.

[0152] In one preferred embodiment of the present invention, the compound represented by formula (I) may be a compound represented by formula (800):

wherein

X represents CH or N,

Z represents -O-, -NH-, -S-, or -C(=O)-,

R⁸⁰¹ and R⁸⁰², which may be the same or different, represent any group selected from C₁₋₆ alkyl,

R⁸³³ and R⁸³⁴ represent a hydrogen atom, and

R⁸³⁵ and R⁸³⁶ combine with a carbon atom attached thereto to form an unsaturated five- or six-membered carbocyclic or heterocyclic group.

[0153] In one more preferred embodiment of the present invention, in formula (800),

Z represents -O- or -S-,

R⁸⁰¹ and R⁸⁰² represent methyl,

[0154] R⁸³⁵ and R⁸³⁶ combine with a carbon atom attached thereto to form phenyl.

[0155] Specific examples of compounds represented by formula (800) include compound 420.

[0156] In one preferred embodiment of the present invention, the compound represented by formula (I) may be a compound represented by formula (900):

wherein

X represents CH or N,

Z represents -O-, -NH-, -S-, or -C(=O)-,

R⁹⁰¹ and R⁹⁰², which may be the same or different, represent any group selected from C₁₋₆ alkyl,

R⁹²⁰, R⁹²¹, R⁹²³, and R⁹²⁴, which may be the same or different, represent

a hydrogen atom,

a halogen atom,

C₁₋₁₀ alkyl optionally substituted by hydroxyl, a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group,

C₁₋₈ alkoxy,

C₂₋₆ alkenyl optionally substituted by C₁₋₄ alkyl, C₁₋₄ alkoxy, an oxygen atom or phenyl,

phenylcarbonyl optionally substituted by C₁₋₄ alkyl,

amino optionally substituted by phenyl,

nitro, or

a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by C₁₋₆ alkyl,

provided that at least one of R⁹²⁰ and R⁹²⁴ is selected from a group other than a hydrogen atom,

R⁹²² represents

C₁₋₁₀ alkyl optionally substituted by hydroxyl, a saturated or unsaturated six-membered carbocyclic or heterocyclic group,

C₁₋₈ alkoxy,

amino optionally substituted by phenyl,

nitro, or

a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by C₁₋₆ alkyl, and

R⁹²¹ and R⁹²², or R⁹²² and R⁹²³ may combine with a carbon atom attached thereto to form a saturated or un-

saturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by a halogen atom, C₁₋₄ alkyl, C₁₋₄ alkylcarbonyl, C₁₋₆ alkoxy carbonyl, or an oxygen atom, and the carbocyclic or heterocyclic group may condense with another saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group to form a tricyclic group together with the six-membered carbocyclic ring of formula (c).

[0157] In one more preferred embodiment of the present invention, in formula (900),

at least one of R⁹²⁰ and R⁹²⁴ is selected from a group other than a hydrogen atom, and

[0158] R⁹²¹ and R⁹²², or R⁹²² and R⁹²³ combine with a carbon atom attached thereto to form a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by a halogen atom, C₁₋₄ alkyl, C₁₋₄ alkylcarbonyl, C₁₋₆ alkoxy carbonyl, or an oxygen atom. In this case, preferably, Z represents -O-.

[0159] Specific examples of compounds represented by formula (900) include compounds 1 to 5, 7 to 24, 77, 78, 164 to 171, 293 to 306, and 425.

[0160] Examples of preferred compounds according to the present invention include compounds described in the working examples.

[0161] More preferred compounds according to the present invention include compounds 195, 207, 260, 261, 270 to 274, 276, 278, 303, 305, 310, 311, 339, 346, 369, 384 to 387, 392, 395, 396, 400, 411, 421, 422, 431, 436, 437, 440, 441, 451, 459, 461, and 469 described in the working examples.

Salts or solvates of compounds

[0162] The compounds according to the present invention may form pharmaceutically acceptable salts thereof. Preferred examples of such salts include: alkali metal or alkaline earth metal salts such as sodium salts, potassium salts or calcium salts; hydrohalogenic acid salts such as hydrofluoride salts, hydrochloride salts, hydrobromide salts, or hydroiodide salts; inorganic acid salts such as nitric acid salts, perchloric acid salts, sulfuric acid salts, or phosphoric acid salts; lower alkylsulfonic acid salts such as methanesulfonic acid salts, trifluoromethanesulfonic acid salts, or ethanesulfonic acid salts; arylsulfonic acid salts such as benzenesulfonic acid salts or p-toluenesulfonic acid salts; organic acid salts such as fumaric acid salts, succinic acid salts, citric acid salts, tartaric acid salts, oxalic acid salts, maleic acid salts, acetic acid salts, malic acid salts, lactic acid salts, or ascorbic acid salts; and amino acid salts such as glycine salts, phenylalanine salts, glutamic acid salts, or aspartic acid salts.

[0163] The compounds according to the present invention may form solvates. Such solvates include, for example, hydrates, alcoholates, for example, methanolates and ethanolates, and etherates, for example, diethyl etherate.

Production of compounds of formula (I)

[0164] Compounds according to the present invention may be produced, for example, according to schemes 1 to 34. Starting compounds necessary for the synthesis of the compounds according to the present invention are commercially available or alternatively may be easily produced by conventional methods.

[0165] In the following scheme, quinolone derivatives as an intermediate may be synthesized, for example, according to WO 97/17329.

[0166] 4-Chloroquinoline derivatives may be synthesized by a conventional method as described, for example, in Org. Synth. Col. Vol.3, 272 (1955), Acta Chim. Hung., 112, 241 (1983) or WO 98/47873.

[0167] 4-Chloroquinazoline derivatives may be synthesized by a conventional method as described in J. Am. Chem. Soc., 68, 1299 (1946), J. Am. Chem. Soc., 68, 1305 (1946), and Dai Yuuki Kagaku (Great Organic Chemistry), supervised by Kotake, Vol. 17, p 150, Asakura Publishing Co., Ltd. (published in 1967).

[0168] 1 and 2) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a group of formula (c), may be produced, for example, according to scheme 1 and scheme 2 below.

Scheme 1:**Scheme 2:**

wherein each substituent is as defined above.

[0169] The contemplated 4-phenoxyquinoline derivative, 4-anilinoquinoline derivative, or corresponding quinazoline derivative may be synthesized by reacting a phenol derivative or a corresponding aniline derivative with a 4-chloroquinoline derivative or a corresponding quinazoline derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C. In scheme 1, phosphoryl chloride may be used as the chlorinating agent.

[0170] 3) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a group of formulae (a1), (b1) to (b3), and (c), particularly a compound having a substituent of a ketone at the o-position of A, may be produced, for example, according to scheme 3 below.

Scheme 3:

wherein X' represents a halogen atom; and each other substituent is as defined above.

[0171] In this scheme, the contemplated compound of formula (I) may be synthesized by any one of the following three routes (i) to (iii).

(i) The contemplated compound of formula (I) may be synthesized by reacting a 4-chloroquinoline derivative or a corresponding quinazoline derivative with a phenol derivative or a corresponding aniline derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (1) above).

(ii) The contemplated compound of formula (I) may be synthesized by reacting a 4-chloroquinoline derivative or a corresponding quinazoline derivative with an o-bromophenol derivative or a corresponding o-bromoaniline derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (2) above), then subjecting the production products at its bromo site to dipole inversion using a metal base, for example, n-butyllithium, and reacting the produced anion with an acid chloride (step (3) above).

(iii) The contemplated compound of formula (I) may be produced by reacting a 4-chloroquinoline derivative or a corresponding quinazoline derivative with an o-hydroxybenzaldehyde derivative or a corresponding o-aminobenzaldehyde derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (4) above), then reacting the reaction product with an alkylating agent, for example, methylmagnesium bromide (step (5) above), and oxidizing the resultant alcohol (step (6) above).

[0172] 4) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a group of formula (a1) (particularly an amide compound), may be produced, for example, according to scheme 4 below.

Scheme 4:

wherein each substituent is as defined above.

[0175] The contemplated compound of formula (I) may be synthesized by providing a 7-benzyloxy-4-chloroquinoline

derivative or a corresponding quinazoline derivative, reacting the derivative with a phenol derivative or a corresponding aniline derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (1) above), then deprotecting a benzyl group in the intermediate 5-1 thus obtained with an acid (step (2) above), and reacting the intermediate 5-2 thus obtained with an alkylating agent, for example, 1-bromo-2-chloroethane, in the presence of a base (step (3) above).

[0176] 6) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and Z represents $-C(=O)-$, may be produced, for example, according to scheme 6 below.

Scheme 6:

wherein each substituent is as defined above.

[0177] The contemplated compound of formula (I) may be produced by reacting a 4-quinolone derivative or a corresponding quinazolinone derivative with a brominating agent, for example, phosphoryl bromide (step (1) above) and then subjecting the reaction product at its bromo site to dipole inversion using a metal base, for example, n-butyllithium, and reacting the resultant anion with an acid chloride (step (2) above).

[0178] 7) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and in which A represents a group of formula (c) and R^{24} represents optionally substituted alkenyl, may be produced, for example, according to scheme 7 below.

Scheme 7:

wherein each substituent is as defined above.

[0179] The contemplated compound of formula (I) may be synthesized by reacting a 4-chloroquinoline derivative or a corresponding quinazolinone derivative with an o-hydroxybenzaldehyde derivative or a corresponding o-aminobenzaldehyde derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (1) above) and then reacting the reaction product with a Wittig reagent or a Horner-Emmons reagent, for example, phosphorus ylide (step (2) above).

[0180] 8) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a group of formula (a2), may be produced, for example, according to scheme 8 below.

Scheme 8:

wherein each substituent is as defined above.

[0181] The contemplated compound of formula (I) may be synthesized by reacting a 4-chloroquinoline derivative or a corresponding quinazoline derivative with an o-hydroxybenzaldehyde derivative or a corresponding o-aminobenzaldehyde derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (1) above) and then reacting the reaction product with an amine ($R^{11}R^{12}NH$) to give an imine which is then reduced (step (2) above).

[0182] 9) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II), A represents a group of formula (c) and the group of formula (c) has an amino group substituted by phenyl, may be produced, for example, according to scheme 9 below.

Scheme 9:

wherein each substituent is as defined above.

[0183] The contemplated compound of formula (I) may be synthesized by reacting a 4-chloroquinoline derivative or a corresponding quinazoline derivative with an o-nitrophenol derivative or a corresponding o-nitroaniline derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (i) above), then reducing the nitro group (step (ii) above), and reacting the reduction product with a phenylboronic acid derivative (step (iii) above).

[0184] 10) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II), A represents a group of formula (c) and the group of formula (c) has a nitrogen-containing five-membered heterocyclic group, may be produced, for example, according to scheme 10 below.

Scheme 10:

wherein each substituent is as defined above.

[0185] The contemplated compound of formula (I) may be synthesized by reacting a 4-chloroquinoline derivative or a corresponding quinazoline derivative with a 5-hydroxyindole derivative or a corresponding 5-aminoindole derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (i) above) and then alkylating the amino group with an alkylating agent, for example, methyl iodide, or acylating the amino group with an acylating agent, for example, acetyl chloride (step (ii) above).

[0186] 11) A given compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a group of formula (c), for example, compound 23, may be produced, for example, according to scheme 11 below.

Scheme 11:

wherein each substituent is as defined above.

[0187] The contemplated compound may be synthesized by reacting a 4-chloroquinoline derivative or a corresponding quinazoline derivative with 3-hydroxy-6-nitrobenzaldehyde derivative or a corresponding 5-amino-2-nitrobenzaldehyde derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent (step (i) above), then reducing the formyl group (step (ii) above), then reducing the nitro group of the resultant compound (step (iii) above), and reacting the reduction product with a carbonylating agent, for example, triphosgene (step (iv) above).

[0188] 12) A given compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a group of formula (a1), for example, compound 76, and a given compound in which A represents a group of formula (c), for example, compound 165, may be produced, for example, according to scheme 12 below.

Scheme 12:

wherein each substituent is as defined above.

[0189] The compound of formula (12-1) may be produced by reacting an anisole derivative with an acid chloride in the presence of a Lewis acid (step (i) above) and deprotecting the methoxy group (step (ii) above).

[0190] Alternatively, the compound of formula (12-1) may be produced by acylating a phenol derivative with an acylating agent, for example, acetyl chloride or acetic anhydride (step (iii) above) and then reacting the acylation product with a Lewis acid, for example, scandium trifluoromethanesulfonate (step (iv) above).

[0191] Next, the contemplated compound, for example, compound 76, may be synthesized by reacting the compound of formula (12-1) with the 4-chloroquinoline derivative or a corresponding quinazoline derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (v) above).

[0192] The contemplated compound, for example, compound 165, may also be synthesized by reducing the acyl group in the resultant compound (step (vi) above).

[0193] 13) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a pyridine ring, that is, a group of formula (b1), may be produced, for example, according to scheme 13 below.

Scheme 13:

wherein each substituent is as defined above.

[0194] The contemplated compound may be synthesized by reacting a 4-chloroquinoline derivative or a corresponding quinazoline derivative with a 3-hydroxypyridine derivative or a corresponding 3-aminopyridine derivative in a suitable solvent, for example, o-dichlorobenzene, in the absence of a solvent, for example, at 120 to 180°C (step (i) above).

[0195] Alternatively, a method may also be adopted in which a 4-chloroquinoline derivative or a corresponding quinazoline derivative is reacted with a 3-hydroxy-2-pyridinecarbaldehyde derivative or a corresponding 3-amino-2-pyridinecarbaldehyde derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (ii) above), and the reaction product is then reacted with an alkylating agent, for example, methylmagnesium bromide (step (iii) above).

[0196] Next, the contemplated compound, for example, compound 117, may be synthesized by oxidizing the resultant alcoholic compound, for example, with manganese dioxide as an oxidizing agent (step (iv) above).

[0197] Alternatively, another contemplated compound, for example, compound 218, may be synthesized by alkylating the hydroxyl group in the resultant alcoholic compound with an alkylating agent, for example, methyl iodide or ethyl iodide, or by acylating the hydroxyl group in the resultant alcoholic compound with an acylating agent, for example, acetyl chloride or acetic anhydride (step (v) above). Further, still another contemplated compound, for example, compound 214, may be synthesized by reducing this compound, for example, with hydrogen gas/ palladium hydroxide as a reducing agent (step (vi) above).

[0198] 14) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a group of formula (c), particularly a compound in which a substituent such as an iodine atom is present at the o-position of the group of formula (c) represented by A, may be produced, for example, according to scheme 14 below.

Scheme 14:

wherein each substituent is as defined above.

[0199] The contemplated compound may be produced by reacting a phenol derivative with iodine (step (i) above), then reacting the allyliodide with an alkytin reagent, for example, tri-n-butyl-(2-pyridyl)-tin, or an alkylboronic acid reagent, for example, 3-pyridylboronic acid, in the presence of a suitable transition metal catalyst, for example, tetrakis triphenylphosphine palladium (step (ii) above), and reacting the resultant phenol derivative with a 4-chloroquinoline derivative or a corresponding quinazolone derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (iii) above).

[0200] 15) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a group of formula (a1), particularly a compound in which alkoxy is present as a substituent at the 4-position of the group of formula (a1) represented by A may be produced, for example, according to scheme 15 below.

Scheme 15:

wherein each substituent is as defined above.

[0201] The contemplated compound may be produced by reacting a 2,5-dihydroxyphenyl ketone derivative with a benzylating agent, for example, benzyl bromide (step (i) above), reacting the resultant monophenol derivative with a 4-chloroquinoline derivative or a corresponding quinazolone derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (ii) above), then deprotecting the benzyl group in the resultant compound with a suitable acid, for example, methanesulfonic acid/trifluoroacetic acid, or by reduction (step (iii) above), and alkylating the phenolic hydroxyl group in the resultant compound with an alkylating agent, for example, ethyl iodide (step (iv) above).

[0202] 16 The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a group of formula (a1), particularly a compound in which the group of formula (a1) represented by A has a naphthalene structure, may be produced, for example, according to scheme 16 below.

Scheme 16:

wherein

Q represents, for example, chlorine or N,O-dimethylhydroxylamine and each of the other substituents is as defined above.

[0203] In this scheme, the contemplated compound may be synthesized by the following two routes.

(I) An ester derivative is produced by reacting a hydroxynaphthalenecarboxylic acid derivative with a suitable carbonyl activating agent, for example, thionyl chloride (step (i) above) and then reacting the resultant active form of carboxylic acid derivative with an alcohol (step (ii) above). Next, the contemplated compound may be produced by reacting the ester derivative with a 4-chloroquinoline derivative or a corresponding quinazoline derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (iii) above).

(II) A ketone derivative is produced by reacting the active form of carboxylic acid derivative produced in step (i) with an alkylating agent, for example, methylmagnesium bromide (step (iv) above). Next, the contemplated compound may be produced by reacting the ketone derivative with a 4-chloroquinoline derivative or a corresponding quinazoline derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (v) above).

[0204] 17) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a group of formula (b1), particularly a compound in which alkoxy is present at the o-position of the group of formula (b1), can be produced, for example, according to scheme 17 below.

Scheme 17:

wherein each substituent is as defined above.

[0205] The contemplated compound may be produced by reacting a 2-hydroxypyridine derivative with a 4-chloroquinoline derivative or a corresponding quinazolone derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (i) above) and alkylating the resultant compound with an alkylating agent, for example, ethyl iodide (step (ii) above).

[0206] 18) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a group of formula (b1), particularly a compound in which alkoxy is present at the p-position of the group of formula (b1), can be produced, for example, according to scheme 18 below.

Scheme 18:

wherein

R⁸¹ represents a hydrogen atom or C₁₋₄ alkyl,

D represents an oxygen atom, a nitrogen atom, or a sulfur atom, and
each of the other substituents is as defined above.

[0207] The contemplated compound may be produced by reacting a 2-chloropyridine derivative with a 4-chloroquinoline derivative or a corresponding quinazolone derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (i) above) and reacting the resultant compound with a nucleophilic reagent, for example, methanol (step (ii) above).

[0208] 19) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a group of formula (b1), particularly a compound in which a substituent such as an iodine atom or phenyl is present at the o-position of the group of formula (b1), may be produced, for example, according to scheme 19 below.

Scheme 19:

wherein each substituent is as defined above.

[0209] The contemplated compound may be produced by reacting a 3-hydroxypyridine derivative with iodine in a suitable solvent, for example, methanol (step (i) above), reacting the resultant 2-iodopyridine derivative with a 4-chloroquinoline derivative or a corresponding quinazolinone derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (ii) above), and then reacting the resultant compound with an alkyltin reagent, for example, tri-n-butyl-(2-pyridyl)-tin, or an alkylboronic acid reagent, for example, 3-pyridylboronic acid, in the presence of a suitable transition metal catalyst, for example, tetrakis triphenylphosphine palladium (step (iii) above).

[0210] 20) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a group of formula (b1), particularly a compound having a cyano group at the o-position of the group of formula (b1), may be produced, for example, according to scheme 20 below.

Scheme 20:

wherein each substituent is as defined above.

[0211] Intermediate 20-1 may be produced by reacting the above starting compound with a suitable oxidizing agent, for example, manganese dioxide (step (i) above), then reacting the hydroxyl group, remaining unchanged, in the resultant compound with a suitable benzylating agent, for example, benzyl chloride (step (ii) above). Next, a corresponding cyanopyridine derivative may be produced by reacting intermediate 20-1 with an alkoxyamine (step (iii) above). The cyanopyridine derivative thus obtained is deprotected with a suitable acid, for example, methanesulfonic acid/trifluoroacetic acid, or a suitable reducing agent, for example, hydrogen gas/palladium hydroxide (step (iv) above). The contemplated compound may be produced by reacting the resultant hydroxypyridine derivative with a 4-chloroquinoline derivative or a corresponding quinazolinone derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (v) above).

[0212] 21) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a group of formula (b1), particularly a compound having a specific heterocyclic group at the o-position of the group of formula (b1), for example, compound 256, may be produced, for example, according to scheme 21 below.

Scheme 21:

wherein

R^{82} and R^{83} represent hydroxyl; cyano; a halogen atom; C_{1-4} alkoxy; phenyloxy; C_{1-4} alkylcarbonyl; amino optionally substituted by C_{1-4} alkyl or C_{1-4} alkylcarbonyl; aminocarbonyl optionally substituted by C_{1-4} alkyl; or C_{1-4} alkyl optionally substituted by hydroxyl or a halogen atom, and each of the other substituents is as defined above.

[0213] In this scheme, the contemplated compound may be synthesized by the following two routes.

(I) A ketone derivative may be produced by reacting intermediate 20-1 produced according to scheme 20 with an alkyne metal reagent, for example, 1-propynylmagnesium bromide (step (i) above) and then oxidizing the hydroxy group in the resultant compound with a suitable oxidizing agent, for example, manganese oxide (step (ii) above). A 3-hydroxy-2-isoxazolpyridine derivative may be produced by reacting the resultant ketone derivative with hydroxylamine (step (iii) above) and then reacting the resultant compound with a suitable acid, for example, methanesulfonic acid/trifluoroacetic acid (step (iv) above). The contemplated compound may be produced by reacting the resultant 3-hydroxy-2-isoxazolpyridine derivative with a 4-chloroquinoline derivative or a corresponding quinazolinone derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (v) above).

(II) A ketone derivative may be produced by reacting intermediate 20-1 produced according to scheme 20 with an alkyne metal reagent, for example, 1-propynylmagnesium bromide (step (i) above) and then oxidizing the hydroxy group in the resultant compound with a suitable oxidizing agent, for example, manganese oxide (step (ii) above). An N-alkylpyrazole derivative may be produced by reacting the ketone derivative with hydrazine (step (vi) above) and reacting the resultant compound with an alkylating agent, for example, methyl iodide (step (vii) above). A 3-hydroxypyridine derivative may be produced by reacting the resultant N-alkylpyrazole derivative with a suitable acid, for example, methanesulfonic acid/trifluoroacetic acid (step (viii) above). Next, the contemplated compound may be produced by reacting the resultant 3-hydroxypyridine derivative with a 4-chloroquinoline derivative or a corresponding quinazolinone derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (ix) above).

[0214] 22) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a group of formula (b1), particularly a compound in which aminomethyl is present at the o-position of the group of formula (b1), may be produced, for example, according to scheme 22 below.

Scheme 22:

wherein

Qx represents a halogen atom, preferably a chlorine atom or a bromine atom, and each substituent is as defined above.

[0215] A quinoline derivative may be produced by reacting a 3-hydroxy-2-methylpyridine derivative with a 4-chloroquinoline derivative or a corresponding quinazolinone derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (i) above). The contemplated compound may be produced by reacting the resultant compound with a suitable base, for example, lithium diisopropylamide to produce a carbanion, reacting the carbanion with a halogenating agent, for example, N-bromosuccinimide (step (ii) above) and then reacting the resultant compound with an amine (step (iii) above).

[0216] 23 to 25) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a group of formula (b1), particularly a compound in which carbonyl is present at the o-position of the group of formula (b1), may be produced, for example, by any one of schemes 23 to 25 below.

Scheme 23:

wherein at least one of Es represents a heteroatom such as a nitrogen atom with the remaining Es representing a carbon atom, or all Es represent a carbon atom; and each of the other substituents in the scheme is as defined above.

[0217] In this scheme, the contemplated compound may be synthesized by the following two routes.

(I) A ketone derivative may be produced by reacting a 3-hydroxy-2-methylquinoline derivative with a suitable oxidizing agent, for example, selenium dioxide (step (i) above), reacting the resultant aldehyde derivative with a metal alkylating agent, for example, methylmagnesium bromide (step (ii) above), and then oxidizing the resultant alcoholic compound with a suitable oxidizing agent, for example, manganese dioxide (step (iii) above). The contemplated compound may be produced by reacting the resultant ketone derivative with a 4-chloroquinoline derivative or a corresponding quinazolinone derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (vi) above).

(II) A 3-hydroxyquinoline derivative may be produced by reacting an acid chloride derivative with silyl enol ether, for example, 4-trimethylsilyloxy-pent-3-en-2-one (step (iv) above) and then reacting the resultant ketone derivative with a suitable base, for example, an aqueous potassium hydroxide solution (step (v) above). The contemplated compound may be produced by reacting the 3-hydroxyquinoline derivative with a 4-chloroquinoline derivative or a corresponding quinazolinone derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (vi) above).

Scheme 24:

wherein

at least any one of Es represents a heteroatom, for example, a nitrogen atom, with the remaining other Es representing a carbon atom, or all Es represent a carbon atom,

T represents a halogen atom, preferably a bromine atom, and
each of the other substituents in the scheme is as defined above.

[0218] A 2,3-dihydroxyquinoline derivative may be produced by reacting an aniline derivative with chloroacetyl chloride (step (i) above) and then reacting the resultant amide derivative with a suitable base, for example, an aqueous potassium hydroxide solution (step (ii) above). A 2-hydroxyquinoline derivative may be produced by reacting the resultant 2,3-dihydroxyquinoline derivative with a 4-chloroquinoline derivative or a corresponding quinazolone derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (iii) above). A 2-haloquinoline derivative may be produced by reacting the resultant 2-hydroxyquinoline derivative with a suitable halogenating agent, for example, tetrabutylammonium bromide (step (iv) above). The contemplated compound may be produced by reacting the 2-haloquinoline derivative with an alkyltin reagent, for example, tri-n-butyl-(2-pyridyl)-tin, or an alkylboronic acid reagent, for example, 3-pyridylboronic acid, in the presence of a suitable transition metal catalyst, for example, tetrakis triphenylphosphine palladium (step (v) above).

Scheme 25:

wherein at least any one of Es represents a heteroatom, for example, a nitrogen atom, with the remaining other Es representing a carbon atom, or all Es represent a carbon atom, and each of the other substituents in the scheme is as defined above.

[0219] An amide derivative may be produced by reacting an aniline derivative with pivaloyl chloride (step (i) above). Next, an o-acylaniline derivative may be produced by reacting the resultant amide derivative with a suitable alkylolithium, for example, n-butyllithium to give an anion, reacting the anion with an acylating agent, for example, N,N-dimethylformamide (step (ii) above), then deprotecting the pivaloyl group with a suitable acid, for example, hydrochloric acid (step (iii) above). The contemplated compound may be produced by reacting the o-acylaniline derivative with a methyl ketone derivative (step (iv) above) to give a 3-hydroxyquinoline derivative and then reacting the 3-hydroxyquinoline derivative with a 4-chloroquinoline derivative or a corresponding quinazolone derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (v) above).

[0220] 26) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a group of formula (c), for example, compound 297, may be produced, for example, according to scheme 26 below.

Scheme 26:

wherein each substituent is as defined above.

[0221] The contemplated compound may be produced by reacting a 6-benzyloxy-4-chloroquinoline derivative with a suitable reducing agent, for example, hydrogen gas/palladium hydroxide (step (i) above) to give a 6-hydroxyquinoline derivative and reacting the 6-hydroxyquinoline derivative with a 4-chloroquinoline derivative or a corresponding quina-

zolone derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (ii) above).

[0222] 27) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a group of formula (c), for example, compound 299, may be produced, for example, according to scheme 27 below.

Scheme 27:

wherein each substituent is as defined above.

[0223] A trifluoromethanesulfonate derivative may be produced by reacting a 7-benzyloxy-4-chloroquinoline derivative with a suitable reducing agent, for example, hydrogen gas/palladium hydroxide to give an alcohol (step (i) above) and then reacting the alcohol with trifluoromethanesulfonic anhydride (step (ii) above) to give a trifluoromethanesulfonate derivative. A quinoline derivative may be produced by reacting the trifluoromethanesulfonate derivative with an alkytin reagent, for example, tri-n-butyl-(2-pyridyl)-tin or an alkyboronic acid reagent, for example, 3-pyridylboronic acid in the presence of a suitable transition metal catalyst, for example, tetrakis triphenylphosphine palladium (step (iii) above) and reacting the resultant compound with a suitable oxidizing agent, for example, 2,3-dichloro-5,6-dicyano-1,4-benzoquinone, to give a quinoline derivative (step (iv) above). Next, a 6-hydroxyquinoline derivative may be produced by reacting the quinoline derivative with a suitable reagent, for example, boron tribromide (step (v) above). The contemplated compound may be produced by reacting the 6-hydroxyquinoline derivative with a 4-chloroquinoline derivative or a corresponding quinazolinone derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (vi) above).

[0224] 28 and 29) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a group of formula (c), particularly a compound in which the group of formula (c) has an isoquinoline structure, may be produced, for example, according to scheme 28 or 29 below.

Scheme 28:

wherein each substituent is as defined above.

[0225] A 6-methoxyisoquinoline derivative may be produced by reacting a 4-methoxybenzaldehyde derivative with a dimethoxyalkylamine derivative to give an imine derivative (step (i) above) and reacting the imine derivative with a suitable Lewis acid, for example, titanium tetrachloride, to give a 6-methoxyisoquinoline derivative (step (ii) above). A 6-hydroxyisoquinoline derivative may be produced by reacting the 6-methoxyisoquinoline derivative with a suitable reagent, for example, boron tribromide (step (iii) above). Next, the contemplated compound may be produced by reacting the 6-hydroxyisoquinoline derivative with a 4-chloroquinoline derivative or a corresponding quinazolone derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (iv) above).

Scheme 29:

wherein each substituent is as defined above.

[0226] A 6-methoxyisoquinoline derivative may be produced by reacting a 3-bromo-4-methoxybenzaldehyde derivative with a dimethoxyalkylamine derivative to give an imine derivative (step (i) above) and then reacting the imine derivative with a suitable Lewis acid, for example, titanium tetrachloride, to give a 6-methoxyisoquinoline derivative (step (ii) above). A 6-hydroxyisoquinoline derivative may be produced by reacting the 6-methoxyisoquinoline derivative with a suitable reagent, for example, boron tribromide (step (iii) above). Next, the 6-hydroxyisoquinoline derivative is reacted with a 4-chloroquinoline derivative or a corresponding quinazalone derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (iv) above). The contemplated compound may be produced by reacting the resultant compound with an alkyltin reagent, for example, tri-n-butyl-(2-pyridyl)-tin, or an alkylboronic acid reagent, for example, 3-pyridylboronic acid, in the presence of a suitable transition metal catalyst, for example, tetrakis triphenylphosphine palladium (step (v) above).

[0227] 30) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a group of formula (c), for example, compound 305, may be produced, for example, according to scheme 30 below.

Scheme 30:

wherein each substituent is as defined above.

[0228] An alkyl 3-alkoxybenzoate derivative may be produced by reacting a 3-hydroxybenzoic acid derivative with an alkylating agent, for example, methyl iodide, (step (i) above). An aniline derivative may be produced by reacting the alkyl 3-alkoxybenzoate derivative with nitric acid in the presence of a suitable acid, for example, acetic acid (step (ii) above) and then reducing the resultant nitro group with a suitable reducing agent, for example, hydrogen gas/palladium hydroxide to give an aniline derivative (step (iii) above). A 4-chloroquinazoline derivative may be produced by reacting the amino group in the aniline derivative with an alkylamide (step (iv) above) and then reacting the resultant compound with a suitable halogenating agent, for example, phosphorus oxychloride (step (v) above). Next, a 6-hydroxyquinazoline derivative may be produced by reducing the 4-chloroquinazoline derivative with a suitable reducing agent, for example, hydrogen gas/palladium hydroxide (step (vi) above) and then reacting the resultant compound with a suitable reagent, for example, boron tribromide (step (vii) above). The contemplated compound may be produced by reacting the 6-hydroxyquinazoline derivative with a 4-chloroquinoline derivative or a corresponding quinazolinone derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (viii) above).

[0229] 31) The compound, which is represented by formula (I) wherein R' represents a group other than -OR^a, may be produced, for example, according to scheme 31 below.

Scheme 31:

wherein each substituent is as defined above.

[0230] A trifluoromethanesulfonate derivative may be produced by reacting a 7-benzyloxy-4-chloroquinoline derivative or a corresponding quinazolone derivative with a suitable acid, for example, methanesulfonic acid/trifluoroacetic acid to give an alcohol (step (i) above) and then reacting the alcohol with trifluoromethanesulfonic anhydride (step (ii) above). The trifluoromethanesulfonate derivative is reacted with an amine or an alkene in the presence of a suitable transition metal catalyst, for example, tetrakis triphenylphosphine palladium (step (iii) above). The contemplated compound may be produced by reacting the resultant compound with a phenol derivative or a corresponding aniline derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (iv) above).

[0231] 32) The compound, which is represented by formula (I) wherein R represents a group other than methoxy, may be produced, for example, according to scheme 32 below.

Scheme 32:

wherein each substituent is as defined above.

[0232] A 6-benzyloxy-4-chloroquinoline derivative or a corresponding quinazolone derivative is reacted with a phenol derivative or a corresponding aniline derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (i) above). Next, a 6-hydroxyquinoline derivative may be produced by reacting the resultant compound with a suitable acid, for example, methanesulfonic acid/trifluoroacetic acid (step (ii) above). The contemplated compound may be produced by reacting the 6-hydroxyquinoline derivative with an alkylating

agent, for example, 1-bromo-2-chloroethane (step (iii) above).

[0233] 33) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a group of formula (a3), may be produced, for example, according to scheme 33 below.

Scheme 33:

wherein each substituent is as defined above.

[0234] The contemplated compound may be produced by reacting a 4-chloroquinoline derivative or a corresponding quinazoline derivative with a phenol derivative or a corresponding aniline derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (i) above) and then reacting the resultant compound with an amine derivative (step (ii) above).

[0235] 34) The compound, which is represented by formula (I) and in which formula (I) is represented by formula (II) and A represents a group of formula (b1), particularly a compound in which an aromatic substituent is present at the o-position of the group of formula (b1) and methyl is present at the m-position and p-position, may be produced, for example, according to scheme 34 below.

Scheme 34:

wherein each substituent is as defined above.

[0236] In this scheme, the contemplated compound may be synthesized by the following two routes.

(I) An alcohol derivative is produced by reacting a furfural derivative with an alkyl metal reagent, for example, phenylmagnesium bromide (step (i) above). A ketone derivative may be produced by oxidizing the alcohol derivative with a suitable oxidizing agent, for example, manganese dioxide (step (ii) above). Next, a 3-hydroxy-pyridine derivative may be produced by reacting the ketone derivative with ammonia (step (iv) above). Further, the contemplated compound may be produced by reacting the 3-hydroxypyridine derivative with a 4-chloroquinoline derivative or a corresponding quinazolinone derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C.

(II) A ketone derivative may be produced by reacting a furan derivative with an alkyllithium reagent, for example, n-butyllithium, and then reacting the resultant compound with an acylating agent, for example, benzoyl chloride (step (iii) above). A 3-hydroxypyridine derivative may be produced by reacting the ketone derivative with ammonia (step (iv) above). Next, the contemplated compound may be produced by reacting the 3-hydroxypyridine derivative with a 4-chloroquinoline derivative or a corresponding quinazolinone derivative in a suitable solvent, for example, o-dichlorobenzene, or in the absence of a solvent, for example, at 120 to 180°C (step (v) above).

Use of compounds/pharmaceutical composition

[0237] Compounds according to the present invention inhibit the action of TGF β on cells in vitro (see Test Example 1).

[0238] As described in the section of the background art, the inhibition of TGF β has been regarded as useful for the prophylaxis or therapy of all diseases involving fibrosis including chronic renal diseases. Examples of references showing a correlation between TGF β and these diseases are as described in the section of the background art.

[0239] Further, compounds according to the present invention actually exhibited anti-fibrosis activity in vivo (see Test Examples 2 to 4).

[0240] Accordingly, the compounds according to the present invention can be used for the prophylaxis or therapy of diseases for which the TGF β inhibitory activity is effective therapeutically.

[0241] The term "TGF β inhibitory activity" as used herein means that the compound has the activity of inhibition against the activity of TGF β , a kind of cytokine, within cells or tissues.

[0242] According to the present invention, there is provided a method for preventing or treating a disease for which TGF β inhibition is effective therapeutically, comprising the step of administering a therapeutically or prophylactically effective amount of the compound according to the present invention to a patient. The term "patient" as used herein

refers to a patient who should undergo therapy of a disease for which TGF β inhibition is effective therapeutically or prophylactically.

[0243] According to the present invention, there is provided use of the compound according to the present invention, for the manufacture of a therapeutic or prophylactic agent for a disease for which TGF β inhibition is effective therapeutically or prophylactically.

[0244] According to the present invention, there is provided a pharmaceutical composition comprising the compound according to the present invention or a pharmaceutically acceptable salt or solvate thereof. The pharmaceutical composition according to the present invention can be used for the prophylaxis or therapy of diseases for which the TGF β inhibitory activity is effective therapeutically or prophylactically.

[0245] The diseases for which the TGF β inhibitory activity is effective therapeutically or prophylactically are preferably diseases involving fibrosis of an organ or a tissue.

[0246] Diseases for which TGF β inhibition is effective therapeutically or prophylactically include chronic renal disease, acute renal disease, hepatic fibrosis, cirrhosis, pulmonary fibrosis, scleroderma, wound healing, arthritis, congestive cardiac disease, ulcer, ocular disorder, cornea disorder, diabetic nephropathy, peritoneal sclerosis, arterial sclerosis, peritoneal adhesion, and subdermal adhesion.

[0247] In another preferred embodiment of the present invention, the disease for which TGF β inhibition is effective therapeutically or prophylactically is a malignant tumor.

[0248] In still another preferred embodiment of the present invention, the compound or pharmaceutical composition according to the present invention may be used for in vitro amplification of cells. The cells are preferably hematopoietic stem cells.

[0249] Accordingly, in a further preferred embodiment of the present invention, there is provided a method for amplifying cells in vitro, comprising the step of addition of the compound according to the present invention or a pharmaceutically acceptable salt or solvate thereof in an amount effective for promoting cell amplification, into targeted cells.

[0250] In a still further embodiment of the present invention, there is provided an accelerator for in vitro amplification of cells, comprising the compound according to the present invention or a pharmaceutically acceptable salt or solvate thereof.

[0251] In another embodiment of the present invention, there is provided a TGF β inhibitor comprising the compound according to the present invention or a pharmaceutically acceptable salt or solvate thereof.

[0252] The compounds according to the present invention can be administered to human and non-human animals either orally or parenterally by administration routes, for example, intravenous administration, intramuscular administration, subcutaneous administration, rectal administration, or percutaneous administration.

[0253] Therefore, the pharmaceutical composition comprising the compound according to the present invention is formulated into suitable dosage forms according to the administration routes. Specifically, oral preparations include tablets, capsules, powders, granules, and syrups, and parental preparations include injections, suppositories, tapes, and ointments.

[0254] These various drug formulations may be prepared by conventional methods, for example, with pharmaceutically acceptable carriers, that is, commonly used excipients, disintegrants, binders, lubricants, colorants, and diluents.

[0255] Excipients include, for example, lactose, glucose, corn starch, sorbit, and crystalline cellulose. Disintegrants include, for example, starch, sodium alginate, gelatin powder, calcium carbonate, calcium citrate, and dextrin. Binders include, for example, dimethylcellulose, polyvinyl alcohol, polyvinyl ether, methylcellulose, ethylcellulose, gum arabic, gelatin, hydroxypropylcellulose, and polyvinyl pyrrolidone. Lubricants include, for example, talc, magnesium stearate, polyethylene glycol, and hydrogenated vegetable oils.

[0256] In preparing the injectable solutions, if necessary, for example, buffers, pH adjusters, stabilizers, tonicity agents, and preservatives may be added.

[0257] The content of the compound according to the present invention in the pharmaceutical composition according to the present invention may vary depending upon the dosage form. In general, however, the content is 0.5 to 50% by weight, preferably 1 to 20% by weight, based on the whole composition.

[0258] The dose may be appropriately determined in consideration of, for example, the age, weight, sex, difference in diseases, and severity of condition of individual patients, for example, in the range of 0.1 to 100 mg/kg, preferably in the range of 0.1 to 30 mg/kg. This dose is administered at a time daily or divided doses of several times daily.

[0259] The compound according to the present invention may be administered in combination with other medicament, for example, a carcinostatic agent. In this case, the compound according to the present invention may be administered simultaneously with or after or before the administration of other medicament. The type, administration intervals and the like of the carcinostatic agent may be determined depending upon the type of cancer and the condition of patients.

[0260] When the compound according to the present invention is used in in-vitro amplification of cells, a proper medium may be selected or prepared, for example, according to the type of cells. The amount of the compound according to the present invention added to the medium may be properly determined depending upon the type, application and the like of the cells. The addition amount is preferably 0.01 to 50 μ M, more preferably 0.1 to 20 μ M.

[0261] In another one embodiment of the present invention, there is provided a method for inhibiting the action of TGF β on cells, comprising the step of applying an effective amount of the compound according to the present invention to cells present in vitro or in the body.

5 [EXAMPLES]

[0262] The present invention is further illustrated by the following Examples that are not intended as a limitation of the invention.

10 Example 1

[0263] In the following Examples, Production Example 1 is Production Example of intermediate 1 in scheme 3, Production Example 2 is Production Example of intermediate 2 in scheme 4, and Production Examples 3 and 4 are respectively Production Examples of intermediates 3 and 4 in scheme 5.

15 Production Example 1: 2-[(6,7-Dimethoxy-4-quinolyl)oxy]-5-methylbenzaldehyde (intermediate 1)

[0264] 4-Chloro-6,7-dimethoxyquinoline (113 mg), 2-hydroxy-5-methylbenzaldehyde (344 mg), and 4-dimethylaminopyridine (313 mg) were suspended in o-dichlorobenzene (5 ml), and the suspension was stirred at 160°C for 2 hr. The reaction solution was cooled to room temperature, and the solvent was then removed therefrom by distillation under the reduced pressure. Chloroform was added to the residue. The organic layer was washed with a 1 N aqueous sodium hydroxide solution and saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed therefrom by distillation under the reduced pressure. The residue was purified by column chromatography using chloroform to give the title compound (157 mg, yield 96%).

¹H-NMR (CDCl₃, 400 MHz): δ 2.46 (s, 3H), 4.06 (s, 3H), 4.06 (s, 3H), 6.44 (d, J = 5.1 Hz, 1H), 7.10 (d, J = 8.3 Hz, 1H), 7.45 (s, 1H), 7.49 (m, 1H), 7.57 (s, 1H), 7.83 (d, J = 1.9 Hz, 1H), 8.51 (d, J = 1.5 Hz, 1H), 10.28 (s, 1H)

Mass spectrometric value (ESI-MS, m/z): 324 (M+1)⁺

20 Production Example 2: 2-(6,7-Dimethoxyquinolin-4-yloxy)-5-methoxybenzoic acid (intermediate 2)

[0265] Ethyl 2-(6,7-dimethoxyquinolin-4-yloxy)-5-methoxybenzoate (143 mg) and lithium hydroxide (78 mg) were suspended in a mixed solvent composed of ethanol (10 ml) and water (1 ml), and the suspension was stirred at room temperature overnight. The solvent was then removed therefrom by distillation under the reduced pressure. Water was added to the residue, and the resultant solution was neutralized with 12N hydrochloric acid. The mixture was then extracted with chloroform. The chloroform layer was washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure to give the title compound (140 mg, yield 100%).

¹H-NMR (CDCl₃-d₁, 400 MHz): δ 3.73 (s, 3H), 3.80 (s, 3H), 3.95 (s, 3H), 6.44 (d, J = 5.6 Hz, 1H), 6.91 - 7.19 (m, 3H), 7.34 (s, 1H), 7.46 (s, 1H), 7.60 (s, 1H), 8.10 (d, J = 5.6 Hz, 1H), 13.26 (brs, 1H)

Mass spectrometric value (ESI-MS, m/z): 356 (M⁺+1)

25 Production Example 3: [2-(7-Benzyloxy-6-methoxyquinolin-4-yloxy)-5-methoxyphenyl]ethanone (intermediate 3)

[0266] 7-Benzyloxy-4-chloro-6-methoxyquinoline (3.00 mg), 5-methoxy-2-acetophenone (6.7 g), and 4-dimethylaminopyridine (4.9 g) were suspended in o-dichlorobenzene (30 ml), and the suspension was stirred at 180°C for 2 hr. The reaction solution was cooled to room temperature. Water was added to the cooled reaction solution, and the mixture was extracted with chloroform. The chloroform layer was washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using acetone-hexane to give the title compound (2.53 g, yield 59%).

¹H-NMR (CDCl₃-d₁, 400 MHz): δ 2.42 (s, 3H), 3.82 (s, 3H), 3.98 (s, 3H), 5.26 (s, 2H), 6.28 (d, J = 5.6 Hz, 1H), 7.03 - 7.08 (m, 1H), 7.23 - 7.51 (m, 9H), 8.39 (d, J = 5.6 Hz, 1H)

Mass spectrometric value (ESI-MS, m/z): 430 (M⁺+1)

30 Production Example 4: [2-(7-Hydroxy-6-methoxyquinolin-4-yloxy)-5-methoxyphenyl]ethanone (intermediate 4)

[0267] [2-(7-Benzyloxy-6-methoxyquinolin-4-yloxy)-5-methoxyphenyl]-ethanone (intermediate 3) (2.52 g) was suspended in a mixed solution composed of methanesulfonic acid (3.0 ml) and trifluoroacetic acid (50 ml), and the sus-

pension was stirred at 70°C for 0.5 hr. The solvent was removed therefrom by distillation under the reduced pressure. Water was added to the residue, and the mixture was neutralized with sodium hydrogencarbonate powder. The mixture was then extracted with chloroform. The chloroform layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure. The residue was purified by column chromatography using acetone-hexane to give the title compound (1.23 g, yield 62%).

¹H-NMR (DMSO-d₆, 400 MHz): δ 2.50 (s, 3H), 3.91 (s, 3H), 4.00 (s, 3H), 6.35 (d, J = 5.2 Hz, 1H), 7.34 (m, 3H), 7.42 (s, 1H), 7.61 (s, 1H), 8.44 (d, J = 5.2 Hz, 1H), 10.24 (brs, 1H)

Mass spectrometric value (ESI-MS, m/z): 338 (M⁺-1)

34	260, 268 to 274, 429 to 433, 435, and 437

Compound 1: 4-(2-Benzylphenoxy)-6,7-dimethoxyquinoline

[0270] 4-Chloro-6,7-dimethoxyquinoline (230 mg) and 2-benzylphenol (254 mg) were suspended in o-dichlorobenzene (1 ml), and the suspension was stirred at 180°C overnight. The reaction solution was cooled to room temperature, and water was added thereto. The mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was then removed therefrom by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using ethyl acetate-hexane to give the title compound (40 mg, yield 10%).

¹H-NMR (CDCl₃, 400 MHz): δ 3.90 (s, 2H), 3.96 (s, 3H), 4.05 (s, 3H), 6.31 (d, J = 5.4 Hz, 1H), 7.07 - 7.37 (m, 9H), 7.40 (s, 1H), 7.44 (s, 1H), 8.42 (d, J = 5.1 Hz, 1H)

Mass spectrometric value (ESI-MS, m/z): 372 (M+1)⁺

Compound 2: 6,7-Dimethoxy-4-[2-(1-propenyl)phenoxy]quinoline

[0271] 4-Chloro-6,7-dimethoxyquinoline (100 mg), 2-(1-propenyl)phenol (231 μl), and 4-dimethylaminopyridine (220 mg) were suspended in o-dichlorobenzene (1 ml), and the suspension was stirred at 140°C for 7 hr. The reaction solution was cooled to room temperature, and the solvent was then removed therefrom by distillation under the reduced pressure. Thereafter, water was added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with water and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-hexane to give the title compound (137 mg, yield 43%).

¹H-NMR (CDCl₃, 400 MHz): δ 1.76 - 1.85 (m, 3H), 4.06 (m, 6H), 6.27 - 6.35 (m, 2H), 6.44 - 6.48 (m, 1H), 7.06 - 7.17 (m, 1H), 7.24 - 7.64 (m, 5H), 8.45 (m, 1H)

Mass spectrometric value (ESI-MS, m/z): 322 (M+1)⁺

Compound 3: 4-(2-Chloro-4-methylphenoxy)-6,7-dimethoxyquinoline

[0272] 4-Chloro-6,7-dimethoxyquinoline (0.89 g), 2-chloro-4-methylphenol (1.0 g), and 4-dimethylaminopyridine (1 g) were suspended in o-dichlorobenzene (10 ml), and the mixture was stirred at 160°C for 2 hr. The reaction solution was cooled to room temperature, and water was then added thereto. The mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine, and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-chloroform to give the title compound (0.92 g, yield 70%).

¹H-NMR (CDCl₃, 400 MHz): δ 2.40 (s, 3H), 4.05 (s, 3H), 4.07 (s, 3H), 6.31 (d, J = 5.1 Hz, 1H), 7.13 (d, J = 8.1 Hz, 1H), 7.16 (m, 1H), 7.35 (m, 1H), 7.44 (s, 1H), 7.61 (s, 1H), 8.47 (d, J = 5.1 Hz, 1H)

Mass spectrometric value (ESI-MS, m/z): 330 (M+1)⁺

Compound 4: 4-(2-Bromo-4-methylphenoxy)-6,7-dimethoxyquinoline

[0273] 4-Chloro-6,7-dimethoxyquinoline (1.33 g) and 2-bromo-4-methylphenol (2.5 ml) were dissolved in o-dichlorobenzene (3 ml), and the solution was stirred at 160°C for 5 hr. The reaction solution was cooled to room temperature, and water was then added to the reaction solution. The mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with aqueous sodium hydroxide solution and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by column chromatography on silica gel using acetone-chloroform to give the title compound (1.83 g, yield 82%).

Compound 5: 6,7-Dimethoxy-4-(2,4-dimethylphenoxy)quinoline hydrochloride

[0274] 4-Chloro-6,7-dimethoxyquinoline (200 mg) and 2,4-dimethylphenol (0.267 ml) were suspended in diethylene glycol dimethyl ether (0.1 ml), and the suspension was stirred at 180°C for 1.5 hr. The reaction solution was cooled to room temperature, and an aqueous sodium hydroxide solution was then added to the reaction solution. The mixture was extracted with chloroform. The chloroform layer was then washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure. The residue was purified by column chromatography on silica gel using acetone-chloroform to give 4-(2,4-dimethylphenoxy)-6,7-dimethoxyquinoline (127 mg, yield 46%).

[0275] 4-(2,4-Dimethylphenoxy)-6,7-dimethoxyquinoline (99 mg) was dissolved in a 10% hydrochloric acid/methanol solution, and the solution was stirred at room temperature for 15 min. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was washed with ethyl acetate to give the title compound (94 mg, yield 85%).

¹H-NMR (CD₃OD, 400 MHz): δ 2.11 (s, 3H), 2.37 (s, 3H), 4.04 (s, 3H), 4.04 (s, 3H), 6.66 (d, J = 6.6 Hz, 1H), 7.21 (m, 1H), 7.23 (m, 1H), 7.31 (m, 1H), 7.63 (s, 1H), 7.78 (s, 1H), 8.75 (d, J = 6.6 Hz, 1H)

Compound 6: 6,7-Dimethoxy-4-[4-methyl-2-(piperidinomethyl)phenoxy]-quinoline

[0276] 2-[(6,7-Dimethoxy-4-quinolyl)oxy]-5-methylbenzaldehyde (88.6 mg) was dissolved in methanol (5 ml). Piperidine (250 mg) was then added to the solution, and the mixture was stirred at room temperature for 10 min. Further, sodium borohydride (17.5 mg) was added thereto, and the mixture was stirred at room temperature for 20 min. Ethyl acetate and water were added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using acetone-hexane to give the title compound (71 mg, yield 66%).

¹H-NMR (CDCl₃, 400 MHz): δ 1.25 - 1.49 (m, 6H), 2.30 - 2.38 (m, 4H), 2.40 (s, 3H), 3.39 (s, 2H), 4.06 (s, 6H), 6.30 (d, J = 5.4 Hz, 1H), 7.01 (d, J = 8.1 Hz, 1H), 7.14 (dd, J = 1.7 Hz, 8.0 Hz, 1H), 7.39 (d, J = 1.4 Hz, 1H), 7.44 (s, 1H), 7.61 (s, 1H), 8.44 (d, J = 5.4 Hz, 1H)

Compound 7: 6,7-Dimethoxy-4-[4-methoxy-2-[(E)-2-phenyl-1-ethenyl]phenoxy]quinoline

[0277] 4-Chloro-6,7-dimethoxyquinoline (2.23 g), 2-hydroxy-5-methoxybenzaldehyde (6.08 g), and 4-dimethylaminopyridine (4.88 g) were suspended in monochlorobenzene (40 ml), and the suspension was stirred at 130°C overnight. The reaction solution was cooled to room temperature, and water was then added thereto. The mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by chromatography on silica gel using ethyl acetate-hexane for development to give 2-[(6,7-dimethoxy-4-quinolyl)oxy]-5-methoxybenzaldehyde (2.72 g).

[0278] Sodium hydride (60 wt% oil, 52 mg) was dissolved in anhydrous tetrahydrofuran (1 ml), and a solution (0.5 ml) of benzylphosphonic acid (114 mg) in tetrahydrofuran was added dropwise to the solution at 0°C under an argon atmosphere. The mixture was stirred at 0°C for 30 min, and a solution (0.5 ml) of 2-[(6,7-dimethoxy-4-quinolyl)oxy]-5-methoxybenzaldehyde (100 mg) in tetrahydrofuran was then added dropwise thereto. The reaction mixture was stirred at room temperature for one hr, and water (1 ml) was then added dropwise thereto to stop the reaction. The mixture was extracted with ethyl acetate, and the ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by chromatography on silica gel using ethyl acetate-hexane for development to give the title compound (100 mg, yield 80%).

Compound 8: Ethyl (E)-3-[2-[(6,7-dimethoxy-4-quinolyl)oxy]-5-methoxyphenyl]-2-methyl-2-propenoate

[0279] 4-Chloro-6,7-dimethoxyquinoline (2.23 g), 2-hydroxy-5-methoxybenzaldehyde (6.08 g), and 4-dimethylaminopyridine (4.88 g) were suspended in monochlorobenzene (40 ml), and the suspension was stirred at 130°C overnight. The reaction solution was cooled to room temperature, and water was then added to the reaction solution. The mixture

was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by chromatography on silica gel using ethyl acetate-hexane for development to give 2-[(6,7-dimethoxy-4-quinolyl)oxy]-5-methoxybenzaldehyde (2.72 g).

[0280] Sodium hydride (60 wt% oil, 52 mg) was dissolved in anhydrous tetrahydrofuran (1 ml), and a solution (0.5 ml) of triethyl 2-phosphonopropionate (119 mg) in tetrahydrofuran was added dropwise thereto under an argon atmosphere at 0°C. The mixture was stirred at 0°C for 30 min, and a solution (0.5 ml) of 2-[(6,7-dimethoxy-4-quinolyl)oxy]-5-methoxybenzaldehyde (100 mg) in tetrahydrofuran was then added dropwise thereto. The reaction mixture was stirred at room temperature for one hr, and water (1 ml) was then added dropwise to stop the reaction. The mixture was extracted with ethyl acetate, and the ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by chromatography on silica gel using ethyl acetate-hexane for development to give the title compound (64 mg, yield 50%).

Compound 9: 1-[2-[(6,7-Dimethoxy-4-quinolyl)oxy]-5-methylphenyl]-1-propanol

[0281] Under an argon atmosphere, 2-[(6,7-dimethoxy-4-quinolyl)oxy]-5-methylbenzaldehyde (intermediate 1) (81.6 mg) was dissolved in tetrahydrofuran (3 ml), and the solution was then cooled to -78°C. A 0.96 M tetrahydrofuran solution (0.4 ml) of ethylmagnesium bromide was added dropwise thereto, and the mixture was stirred at -78°C for 30 min. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure. The residue was purified by thin layer chromatography using acetone-hexane to give the title compound (41 mg, yield 46%).

¹H-NMR (CDCl₃, 400 MHz): δ 0.92 (t, J = 7.3 Hz, 3H), 1.80 (m, 2H), 2.42 (s, 3H), 3.99 (s, 3H), 4.02 (s, 3H), 4.75 (t, J = 6.3 Hz, 1H), 6.24 (d, J = 5.4 Hz, 1H), 6.95 (d, J = 8.3 Hz, 1H), 7.14 (dd, J = 2.2 Hz, 8.0 Hz, 1H), 7.32 (s, 1H), 7.53 (s, 1H), 7.54 (d, J = 1.9 Hz, 1H), 8.13 (d, J = 5.4 Hz, 1H)

Mass spectrometric value (ESI-MS, m/z): 354 (M+1)⁺

Compound 10: 1-[2-[(6,7-Dimethoxy-4-quinolyl)oxy]-5-methylphenyl]-1-pentanol

[0282] Under an argon atmosphere, 2-[(6,7-dimethoxy-4-quinolyl)oxy]-5-methylbenzaldehyde (123.2 mg) was dissolved in tetrahydrofuran (3 ml), and the solution was then cooled to -78°C. A 1.56 M n-hexane solution (0.35 ml) of n-butyllithium was added dropwise thereto, and the mixture was stirred at -78°C for one hr. A saturated aqueous ammonium chloride solution was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using acetone-hexane to give the title compound (59.5 mg, yield 41%).

Compound 13: 6,7-Dimethoxy-4-(4-methyl-2-nitrophenoxy)quinoline

[0285] 4-Chloro-6,7-dimethoxyquinoline (1.15 g) and 4-methyl-2-nitrophenol (1.52 g) were suspended in o-dichlorobenzene (7 ml), and the suspension was stirred at 180°C for 23 hr. The reaction solution was cooled to room temperature. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-chloroform to give the title compound (480 mg, yield 27%).

Mass spectrometric value (ESI-MS, m/z): 341 (M+1)⁺

Compound 14: N-[2-[(6,7-Dimethoxy-4-quinolyl)oxy]-5-methylphenyl]-N-phenylamine

[0286] 6,7-Dimethoxy-4-(4-methyl-2-nitrophenoxy)quinoline (480 mg) was dissolved in triethylamine/N,N-dimethylformamide (2 ml/10 ml), and palladium hydroxide (1.2 g) was added to the solution. The mixture was stirred at room temperature in a hydrogen gas atmosphere overnight. The reaction solution was filtered through Celite, and the solvent was removed therefrom by distillation under the reduced pressure. Water was added to the residue, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-chloroform to give 4-(2-amino-4-methylphenoxy)-6,7-dimethoxyquinoline (240 mg, yield 55%).

[0287] 4-(2-Amino-4-methylphenoxy)-6,7-dimethoxyquinoline (52 mg) was dissolved in triethylamine/N,N-dimethylformamide (0.5 ml/2.5 ml), and phenylboronic acid (100 mg) and copper acetate (250 mg) were added to the solution which was then stirred at room temperature overnight. The reaction solution was filtered, and the solvent was removed therefrom by distillation under the reduced pressure. Water was added to the residue, and the mixture was extracted with ethyl acetate. Next, the ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using acetone-chloroform to give the title compound (50 mg, yield 76%).

Compound 18: 4-[(6-Bromo-2-naphthyl)oxy]-6,7-dimethoxyquinoline

[0292] 4-Chloro-6,7-dimethoxyquinoline (223 mg), 1,6-dibromo-2-naphthol (910 mg), and 4-dimethylaminopyridine (366 mg) were suspended in o-dichlorobenzene (3 ml), and the suspension was stirred at 150°C for 4 hr. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-chloroform to give 4-[(1,6-dibromo-2-naphthyl)oxy]-6,7-dimethoxyquinoline (326 mg, yield 67%).

[0293] 4-[(1,6-Dibromo-2-naphthyl)oxy]-6,7-dimethoxyquinoline (65 mg) was dissolved in tetrahydrofuran (3 ml) to prepare a solution which was then cooled to -78°C. A 1.59 M n-butyllithium/hexane solution (0.4 ml) was added thereto, and the mixture was stirred at -78°C for 20 min. Acetyl chloride (0.2 ml) was added to the reaction solution, and the mixture was stirred at room temperature overnight. Further, water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using acetone-chloroform to give the title compound (28 mg, yield 51%).

Compound 20: 6,7-Dimethoxy-4-[(1-methyl-5-indolyl)oxy]quinoline

[0295] A mixture of 4-chloro-6,7-dimethoxyquinoline (1 g) with 5-hydroxyindole (1.19 g) was stirred at 150°C for 1.5 hr and was cooled to room temperature. Water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with an aqueous sodium hydrogencarbonate solution and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by column chromatography using ethyl acetate-hexane to give 6,7-dimethoxy-4-[(1H-5-indolyl)oxy]quinoline (898 mg, yield 63%).

[0296] 6,7-Dimethoxy-4-[(1H-5-indolyl)oxy]quinoline (50 mg) was dissolved in N,N-dimethylformamide (1 ml), and 60% sodium hydride (7 mg) was added, followed by stirring for 30 min under ice cooling. Methyl iodide (0.0107 ml) was added to the reaction solution, and the mixture was stirred under ice cooling for additional one hr. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using methanol-chloroform to give the title compound (32 mg, yield 62%).

Compound 21: 6,7-Dimethoxy-4-[(1-acetyl-5-indolyl)oxy]quinoline

[0297] 6,7-Dimethoxy-4-[(1H-5-indolyl)oxy]quinoline (50 mg) was dissolved in N,N-dimethylformamide (1 ml), and 60% sodium hydride (7 mg) was added to the solution, followed by stirring under ice cooling for 30 min. Acetyl chloride (16.6 µl) was added to the reaction solution, and the mixture was stirred under ice cooling for additional one hr. Further, water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using methanol-chloroform to give the title compound (23 mg, yield 41%).

Compound 22: Ethyl 5-[(6,7-dimethoxy-4-quinolyl)oxy]-1H-2-indolecarboxylate

[0298] 5-Hydroxy-1H-2-indolecarboxylic acid (328 mg) was dissolved in ethanol (10 ml) to prepare a solution. Concentrated sulfuric acid was added to the solution, and the mixture was heated under reflux for 3 hr. The reaction solution was cooled to room temperature, an aqueous sodium hydrogencarbonate solution was then added thereto, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by column chromatography on silica gel using ethyl acetate-hexane to give ethyl 5-hydroxy-1H-2-indolecarboxylate (336 mg, yield 88%).

[0299] 4-Chloro-6,7-dimethoxyquinoline (362 mg), ethyl 5-hydroxy-1H-2-indolecarboxylate (277 mg), and 4-dimethylaminopyridine (195 mg) were suspended in o-xylene, and the suspension was heated under reflux overnight. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by column chromatography using ethyl acetate-hexane on silica gel to give the title compound (161 mg, yield 30%).

Compound 23: 6-[(6,7-Dimethoxy-4-quinolyl)oxy]-1,4-dihydro-2H-3,1-benzoxazin-2-one

[0300] 4-Chloro-6,7-dimethoxyquinoline (200 mg) and 5-hydroxy-2-nitrobenzaldehyde (299 mg) were suspended in chlorobenzene (2 ml), and the suspension was heated under reflux for 8 hr. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using ethyl acetate-hexane to give 3-[(6,7-dimethoxy-4-quinolyl)oxy]-6-nitrobenzaldehyde (210 mg, yield 66%).

[0301] 3-[(6,7-Dimethoxy-4-quinolyl)oxy]-6-nitrobenzaldehyde (201 mg) was dissolved in chloroform/methanol (5 ml/10 ml), and sodium borohydride (127 mg) was added to the solution under ice cooling. The mixture was stirred at room temperature for one hr, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was used in the next reaction without purification.

[0302] The residue was dissolved in ethyl acetate/N,N-dimethylformamide (5 ml/5 ml) to prepare a solution. Triethylamine (4 ml) and 20% palladium hydroxide (0.9 g) were added to the solution, and the mixture was stirred under a hydrogen gas atmosphere at room temperature overnight. The reaction solution was filtered through Celite, and the solvent was removed by distillation under the reduced pressure. Water was added to the residue, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure. The residue was purified by column chromatography on silica gel using acetone-chloroform to give {2-amino-5-[(6,7-dimethoxy-4-quinolyl)oxy]phenyl}methanol (118 mg, yield 64%) (2 steps).

[0303] {2-Amino-5-[(6,7-dimethoxy-4-quinolyl)oxy]phenyl}methanol (63 mg) was dissolved in heated triethylamine/toluene (1.2 ml/6 ml) to prepare a solution. Triphosgene (98 mg) was added to the solution and was heated under reflux for 2 min. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with chloroform. The chloroform layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by column chromatography on silica gel using acetone-chloroform to give the title compound (24 mg, yield 39%).

[0341] 4-Chloro-6,7-dimethoxyquinoline (111 mg), 5-trifluoromethoxysalicylaldehyde (412 mg), and 4-dimethylaminopyridine (244 mg) were suspended in monochlorobenzene (2 ml), and the suspension was stirred at 130°C overnight.

The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by chromatography on silica gel using ethyl acetate-hexane for development to give 2-[(6,7-dimethoxy-4-quinolyl)oxy]-5-trifluoromethoxybenzaldehyde.

[0342] 2-[(6,7-Dimethoxy-4-quinolyl)oxy]-5-trifluoromethoxybenzaldehyde was dissolved in anhydrous tetrahydrofuran (1 ml) to prepare a solution. A 1 M tetrahydrofuran solution (0.5 ml) of ethylmagnesium bromide was added to the solution at 0°C, and the mixture was stirred at 0°C for one hr. Water (1 ml) was added dropwise to the reaction solution to stop the reaction. The mixture was extracted with ethyl acetate, and the ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure to give 1-[2-[(6,7-dimethoxy-4-quinolyl)oxy]-5-(trifluoromethoxy)phenyl]-1-propanol.

[0343] 1-[2-[(6,7-Dimethoxy-4-quinolyl)oxy]-5-(trifluoromethoxy)phenyl]-1-propanol was dissolved in anhydrous dimethylsulfoxide (1 ml) to prepare a solution, a sulfur trioxide trimethylamine complex (70 mg) was added to the solution at 0°C, and the mixture was stirred at room temperature for 18 hr. Water (1 ml) was added dropwise to the reaction solution to stop the reaction. The mixture was extracted with ethyl acetate, and the ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by chromatography on silica gel using ethyl acetate-hexane for development to give the title compound (18 mg, yield 8%).

Compound 53: 1-[2-[(6,7-Dimethoxy-4-quinolyl)oxy]-5-methylphenyl]-2-methyl-1-propanone

[0345] Under an argon atmosphere, 2-[(6,7-dimethoxy-4-quinolyl)oxy]-5-methylbenzaldehyde (105.3 mg) was dissolved in tetrahydrofuran (3 ml) to prepare a solution, and the solution was then cooled to -78°C. A 0.68 M tetrahydrofuran solution (0.6 ml) of isopropylmagnesium bromide was added dropwise thereto, and the mixture was stirred at -78°C for one hr. A saturated aqueous ammonium chloride solution was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using acetone-hexane to give 1-[2-[(6,7-dimethoxy-4-quinolyl)oxy]-5-methylphenyl]-2-methyl-1-propanol (11.5 mg, yield 10%).

[0346] 1-[2-[(6,7-Dimethoxy-4-quinolyl)oxy]-5-methylphenyl]-2-methyl-1-propanol (9 mg) thus obtained was then

dissolved in 2 ml of methylene chloride under an argon atmosphere to prepare a solution. 1,8-Diazabicyclo[5.4.0]-7-undecene (54 mg) was then added to the solution, and the mixture was cooled to -78°C. N-Tert-butylbenzenesulfonamide (56 mg) was dissolved in methylene chloride, and the solution was added thereto. The mixture was stirred at -78°C for 3 hr, at 0°C for one hr, and at room temperature overnight. Water was added to the reaction solution, and the mixture was extracted with chloroform. The chloroform layer was then washed with saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed therefrom by distillation under the reduced pressure. The residue was purified by thin layer chromatography using acetone-hexane to give the title compound (7.2 mg, yield 80%).

Compound 76: {2-[(6,7-Dimethoxy-4-quinolyl)oxy]-4,5-dimethylphenyl}-(phenyl)methanone hydrochloride

[0369] Commercially available 3,4-dimethylanisole (409 mg) was dissolved in nitromethane (6 ml) to prepare a solution. Lithium perchlorate (1.9 g) and benzoyl chloride (843 mg) were added to the solution, scandium trifluoromethanesulfonate (148 mg) was then added thereto, and the mixture was stirred at room temperature for 3 days. A saturated aqueous sodium hydrogencarbonate solution was added to the reaction solution, and the mixture was extracted with chloroform. The organic layer was washed with saturated brine, was dried over sodium sulfate and was concentrated. The residue was subjected to separation and purification by column chromatography on silica gel using hexane/ethyl acetate as a solvent to give (4,5-dimethyl-2-methoxyphenyl)(phenyl)methanone (667 mg, yield 93%).

[0370] (4,5-Dimethyl-2-methoxyphenyl)(phenyl)methanone (650 mg) was dissolved in dimethylformamide (10 ml) to prepare a solution. Sodium thiomethoxide (379 mg) was added to the solution, and the mixture was stirred while heating under reflux overnight. The reaction solution was cooled to room temperature, water was added thereto, and the mixture was extracted with ethyl acetate. The organic layer was washed with saturated brine, was dried over sodium sulfate and was concentrated. The residue was subjected to separation and purification by column chromatography on silica gel using hexane/ethyl acetate as a solvent to give (4,5-dimethyl-2-hydroxy-phenyl)(phenyl)methanone. The (4,5-dimethyl-2-hydroxy-phenyl)(phenyl)methanone (40 mg) thus obtained and 4-chloro-6,7-dimethoxyquinoline (150 mg) were added to o-dichlorobenzene (0.2 ml), and the mixture was heated at 180°C for two days. The reaction solution was concentrated and was subjected to separation and purification by column chromatography on silica gel using hexane-ethyl acetate. Subsequently, a hydrochloric acid-methanol mixed solution was added thereto, the solvent was removed by distillation, and the residue was suspended in ethyl acetate. The solid thus obtained was collected by filtration, was washed with ethyl acetate, and was then dried to give the title compound (9.2 mg, yield 11%).

Compound 117: 1-[(3-(6,7-Dimethoxy-4-quinolyl)oxy)-6-methyl-2-pyridyl]-1-ethanone

[0425] 2,6-Lutidine-α²,3-diol (0.75 g) was dissolved in methanol/methylene chloride (5 ml/15 ml) to prepare a solution. Manganese dioxide (2.78 g) was added to the solution, and the mixture was stirred at room temperature overnight. The reaction solution was filtered through Celite, and the solvent was removed therefrom by distillation under the reduced pressure. The residue was purified by column chromatography using acetone-chloroform to give 3-hydroxy-6-methyl-2-pyridinecarbaldehyde (642 mg, yield 87%).

[0426] 4-Chloro-6,7-dimethoxyquinoline (330 mg), 3-hydroxy-6-methyl-2-pyridinecarbaldehyde (200 mg), and 4-dimethylaminopyridine (360 mg) were suspended in o-dichlorobenzene (7 ml), and the suspension was stirred at 150°C for 3 hr. The reaction solution was cooled to room temperature and was then purified by column chromatography using acetone-chloroform to give 3-[6,7-dimethoxy-4-quinolyl]oxy-6-methyl-2-pyridinecarbaldehyde (24 mg, yield 5%).

[0427] 3-[6,7-Dimethoxy-4-quinolyl]oxy-6-methyl-2-pyridine-carbaldehyde (24 mg) was dissolved in tetrahydrofuran (4 ml) to prepare a solution which was then cooled to 0°C. A 0.94 M methylmagnesium bromide/tetrahydrofuran solution (0.5 ml) was added to the cooled solution, and the mixture was stirred at room temperature for one hr. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was used in the next reaction without purification.

[0428] The residue was dissolved in methylene chloride (4 ml) to prepare a solution. Manganese dioxide (0.7 g) was added to the solution, and the mixture was stirred at room temperature overnight. The reaction solution was filtered through Celite, and the solvent was removed therefrom by distillation under the reduced pressure. The residue was purified by column chromatography using acetone-chloroform to give the title compound (7 mg, yield 29%) (2 steps).

Compound 163: Ethyl 2-[(6,7-dimethoxy-4-quinolyl)carbonyl]benzoate

[0474] 6,7-Dimethoxyquinolone (0.79 g) was dissolved in chlorobenzene (7 ml) to prepare a solution. Phosphorus oxybromide (3.34 g) was added to the solution, and the mixture was stirred at 150°C for 6 hr. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by column chromatography on silica gel using acetone-chloroform to give 4-bromo-6,7-dimethoxyquinoline (429 mg, yield 42%).

[0475] 4-Bromo-6,7-dimethoxyquinoline (138 mg) was dissolved in tetrahydrofuran (6 ml) to prepare a solution which was then cooled to -78°C. A 1.59 M n-butyllithium/hexane solution (0.3 ml) was added to the cooled solution, and the mixture was stirred at -78°C for 20 min. A solution of phthalic anhydride (250 mg) in tetrahydrofuran (2 ml) was added to the reaction solution, and the mixture was stirred at room temperature for one hr. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was used in the next reaction without purification.

[0476] The residue provided by the above reaction was dissolved in N,N-dimethylformamide (1 ml) to prepare a solution, cesium carbonate (100 mg) and ethyl iodide (0.05 ml) were added to the solution, and the mixture was stirred at room temperature for one hr. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using acetone-chloroform to give the title compound (3 mg, yield 2%) (2 steps).

Compound 164: 4-(2-Iodo-4,5-dimethyl-phenoxy)-6,7-dimethoxy-quinoline

[0477] 3,4-Dimethylphenol (0.68 g) and iodine (1.82 g) were dissolved in methanol/water (10 ml/5 ml), and the mixture was stirred at room temperature overnight. An aqueous sodium sulfite solution was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure. The residue was purified by column chromatography using ethyl acetate-hexane to give 2-iodo-4,5-dimethylphenol (833 mg, yield 64%).

[0478] 2-Iodo-4,5-dimethylphenol (447 mg), 4-chloro-6,7-dimethoxyquinoline (466 mg), and 4-dimethylaminopyridine (539 mg) were suspended in o-dichlorobenzene (20 ml), and the mixture was stirred at 130°C for 4 hr. The reaction solution was cooled to room temperature, and the solvent was then removed by distillation under the reduced pressure. Water was then added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure. The residue was purified by column chromatography using acetone-chloroform to give the title compound (452 mg, yield 50%).

[0479] 4-Methylanisole (732 mg) was dissolved in nitromethane (30 ml) to prepare a solution. Anhydrous lithium perchlorate (3.8 g), methyl 10-chloro-10-oxodecanoate (2 ml), and scandium triflate (300 mg) were added to the solution, and the mixture was stirred at room temperature for 4 hr. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-hexane to give methyl 10-(2-methoxy-5-methyl-phenyl)-10-oxodecanoate (1.6 g, yield 83%).

[0480] Methyl 10-(2-methoxy-5-methyl-phenyl)-10-oxo-decanoate (1.6 g) was dissolved in methylene chloride (30 ml), 1 M boron tribromide (7.5 ml) was added to the solution at -78°C, and the mixture was stirred at room temperature for 30 min. Water was added to the reaction solution, and the mixture was extracted with chloroform, and the chloroform layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-hexane to give methyl 10-(2-hydroxy-5-methyl-phenyl)-10-oxo-decanoate (546 mg, yield 34%).

[0481] Methyl 10-(2-hydroxy-5-methyl-phenyl)-10-oxo-decanoate (546 mg), 4-chloro-6,7-dimethoxyquinoline (397 mg), and 4-dimethylaminopyridine (434 mg) were suspended in o-dichlorobenzene (20 ml), and the suspension was stirred at 120°C overnight. The reaction solution was cooled to room temperature, and the solvent was removed by distillation under the reduced pressure. Water was then added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with water and was dried over anhydrous sodium sulfate, and the solvent was removed by distillation under the reduced pressure. The residue was purified by column chromatography using acetone-hexane to give methyl 10-[2-(6,7-dimethoxy-quinolin-4-yloxy)-5-methyl-phenyl]-10-oxo-decanoate (90 mg, yield 10%).

[0482] Methyl 10-[2-(6,7-dimethoxy-quinolin-4-yloxy)-5-methyl-phenyl]-10-oxo-decanoate (40 mg) was dissolved in tetrahydrofuran (3 ml), 0.93 M diisobutylaluminum hydride (1 ml) was added to the solution at 0°C, and the mixture was stirred at room temperature for 5 hr. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using methanol-chloroform to give the title compound (4.9 mg, yield 13%).

Compound 171: 4-(4-Imidazol-1-yl-2-iodo-phenoxy)-6,7-dimethoxy-quinoline

[0488] 4-(Imidazol-1-yl)phenol (500 mg) was dissolved in water (6 ml), methanol (18 ml), and dichloromethane (6 ml) to prepare a solution. Iodine (1.58 g) was added to the solution, and the mixture was stirred at room temperature for 8 days. An aqueous sodium thiosulfate solution and methanol were added to the reaction solution, and the mixture was stirred and was then concentrated. The concentrate was extracted with chloroform, and the chloroform layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give 4-(imidazol-1-yl)-2-iodophenol (123 mg, yield 14%).

[0489] 4-(Imidazol-1-yl)-2-iodophenol (123 mg), 4-chloro-6,7-dimethoxyquinoline (288 mg), and 4-dimethylaminopyridine (158 mg) were suspended in o-dichlorobenzene (3 ml), and the suspension was stirred at 140°C for 7.5 hr. The reaction solution was cooled to room temperature, water was then added thereto, and the mixture was extracted with

chloroform. The chloroform layer was washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure. The residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (92 mg, yield 45%).

Compound 173: 1-[2-(6,7-Dimethoxy-quinolin-4-yloxy)-5-propyl-phenyl]-ethanone

[0491] 4-n-Propylphenol (1.00 g) was dissolved in dichloromethane (10 ml) to prepare a solution. Pyridine (862 mg) and acetyl chloride (692 mg) were added to the solution, and the mixture was stirred at room temperature overnight. The solvent was removed therefrom by distillation under the reduced pressure. Water was then added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with water and was dried over anhydrous magnesium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by column chromatography using chloroform to give 4-n-propylphenyl acetate (1.09 g, yield 100%).

[0492] 4-n-Propylphenyl acetate (1.07 g) and scandium trifluoromethanesulfonate (345 mg) were suspended in toluene (10 ml), and the suspension was stirred at 120°C for 7 hr. The reaction solution was cooled to room temperature, and the cooled reaction solution was then filtered. The solvent was removed from the filtrate by distillation under the reduced pressure. Water was then added to the residue, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed therefrom by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-hexane to give 2-hydroxy-5-n-propylacetophenone (276 mg, yield 26%).

[0493] 2-Hydroxy-5-n-propylacetophenone (276 mg), 4-chloro-6,7-dimethoxyquinoline (117 mg), and 4-dimethylaminopyridine (191 mg) were suspended in o-dichlorobenzene (6.5 ml), and the suspension was stirred at 130°C for 8 hr. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure. The residue was purified by thin layer chromatography using acetone-hexane to give the title compound (50 mg, yield 26%).

Compound 182: 1-[6-(6,7-Dimethoxy-quinolin-4-yloxy)-indan-5-yl]-ethanone

[0506] 5-Indanol (500 mg) was dissolved in dichloromethane (5 ml) to prepare a solution. Pyridine (439 mg) and acetyl chloride (349 mg) were added to the solution, and the mixture was stirred at room temperature for 6 hr. The solvent was removed by distillation under the reduced pressure, water was then added to the residue, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using chloroform to give indan-5-yl acetate (599 mg, yield 92%).

[0507] Indan-5-yl acetate (599 mg) and scandium trifluoromethane sulfonate (201 mg) were suspended in toluene (5 ml), and the suspension was stirred at 140°C overnight. The reaction solution was cooled to room temperature and was then filtered. The solvent was removed from the filtrate by distillation under the reduced pressure, water was then added to the residue, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-hexane to give 1-(6-hydroxyindan-5-yl)-ethanone (275 mg, yield 46%).

[0508] 1-(6-Hydroxyindan-5-yl)-ethanone (275 mg), 4-chloro-6,7-dimethoxyquinoline (173 mg), and 4-dimethylaminopyridine (286 mg) were suspended in o-dichlorobenzene (5 ml) to prepare a suspension which was stirred at 130°C overnight. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using acetone-hexane to give the title compound (37 mg, yield 13%).

Compound 183: 1-[2-(6,7-Dimethoxy-quinolin-4-yloxy)-5-isopropyl-4-methyl-phenyl]-ethanone

[0509] 4-Isopropyl-3-methylphenol (1.00 g) was dissolved in dichloromethane (10 ml) to prepare a solution. Pyridine (724 mg) and acetyl chloride (615 mg) were added to the solution, and the mixture was stirred at room temperature overnight. The solvent was removed by distillation under the reduced pressure, water was then added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with water and was dried over anhydrous magnesium sulfate, and the solvent was removed by distillation under the reduced pressure. The residue was dried under the reduced pressure to give 4-isopropyl-3-methylphenyl acetate (1.41 g, yield 100%).

[0510] 4-Isopropyl-3-methylphenyl acetate (1.41 g) and scandium trifluoromethane sulfonate (433 mg) were suspended in toluene (5 ml) to prepare a suspension which was then stirred at 140°C overnight. The reaction solution was cooled to room temperature and was filtered, and the solvent was then removed from the filtrate by distillation under the reduced pressure. Water was then added to the residue, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-hexane to give 1-(2-hydroxy-5-isopropyl-4-methyl-phenyl)-ethanone (13 mg, yield 1%).

[0511] 1-(2-Hydroxy-5-isopropyl-4-methyl-phenyl)-ethanone (13 mg), 4-chloro-6,7-dimethoxyquinoline (30 mg), and 4-dimethylaminopyridine (25 mg) were suspended in o-dichlorobenzene (3 ml) to prepare a suspension which was then stirred at 130°C overnight. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using acetone-hexane to give the title compound (2 mg, yield 7%).

Compound 188: [2-(6,7-Dimethoxy-quinolin-4-yloxy)-5-methyl-phenyl]-(4-hydroxy-phenyl)-methanone

[0522] 4-Bromophenol (1.00 g) was dissolved in N,N-dimethylformamide (20 ml) to prepare a solution. Imidazole (0.95 g) and tert-butylchlorodimethylsilane (1.05 g) were added to the solution, and the mixture was stirred at room temperature overnight. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using chloroform to give (4-bromo-phenoxy)-tert-butyl-dimethyl-silane (1.586 g, yield 96%).

[0523] 2-Hydroxy-5-methyl-benzaldehyde (344 mg), 4-chloro-6,7-dimethoxyquinoline (113 mg), and 4-dimethylami-

nopyridine (313 mg) were suspended in o-dichlorobenzene (5 ml), and the suspension was stirred at 160°C for 2 hr. The reaction solution was cooled to room temperature, and the solvent was removed by distillation under the reduced pressure. Water was then added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with aqueous sodium hydroxide solution and saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using chloroform to give 2-(6,7-dimethoxy-quinolin-4-yloxy)-5-methyl-benzaldehyde (157 mg, yield 96%).

[0524] (4-Bromo-phenoxy)-tert-butyl-dimethyl-silane (175 mg) was dissolved in tetrahydrofuran (3 ml) to prepare a solution which was cooled to -78°C. A 1.41 M n-pentane solution (0.86 ml) of tert-butyllithium was added dropwise to the cooled solution, and the mixture was stirred at -78°C for 20 min. A solution of 2-(6,7-dimethoxy-quinolin-4-yloxy)-5-methyl-benzaldehyde (164 mg) in tetrahydrofuran was added dropwise thereto, and the mixture was stirred at -78°C for one hr and then at 0°C for 30 min. A saturated ammonium chloride solution was added thereto to stop the reaction, and the mixture was then extracted with ethyl acetate. The ethyl acetate layer was then washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue as such was used for the next reaction.

[0525] The residue (252 mg) of the reaction was dissolved in methylene chloride (5 ml) to prepare a solution. A solution of 1,8-diazabicyclo[5.4.0]undeca-7-ene (154 mg) in methylene chloride was added to the solution, and the mixture was cooled to -78°C. A solution of N-tert-butylbenzenesulfineimido (164 mg) in methylene chloride was added thereto, and the mixture was stirred at -78°C for one hr. Further, a solution of N-tert-butylbenzenesulfineimido (55 mg) in methylene chloride was added thereto, and the mixture was stirred at -78°C for 30 min and then at 0°C for 20 min. Water was added to the reaction solution, and the mixture was extracted with chloroform. The chloroform layer was then washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue as such was used for the next reaction.

[0526] A part (384 mg) of the residue of the reaction was dissolved in tetrahydrofuran (5 ml) to prepare a solution which was cooled to 0°C. A solution (1 ml) of tetrabutylammonium fluoride in tetrahydrofuran was then added thereto, and the mixture was stirred for 30 min. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-hexane to give the title compound (128 mg, yield 61%) (3 steps).

5 Compound 191: [2-(6,7-Dimethoxy-quinolin-4-yloxy)-5-methyl-phenyl]-[4-(2-morpholin-4-yl-ethoxy)-phenyl]-methanone

[0529] [4-(2-Chloro-ethoxy)-phenyl]-[2-(6,7-dimethoxy-quinolin-4-yloxy)-5-methyl-phenyl]-methanone (compound 189) (51 mg) was dissolved in N,N-dimethylformamide to prepare a solution. Potassium carbonate (84 mg) and morpholine (46 mg) were then added to the solution, and the mixture was stirred at 80°C overnight. The reaction solution was cooled to room temperature, and water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using chloroform-methanol to give the title compound (38 mg, yield 68%).

20 Compound 192: [2-(6,7-Dimethoxy-quinolin-4-yloxy)-5-methoxy-phenyl]-thiazol-2-yl-methanone

[0530] Thiazole (30 μl) was dissolved in tetrahydrofuran (1 ml) to prepare a solution which was cooled under an argon atmosphere to -78°C. n-Butyllithium (1.56 M hexane solution) (260 μl) was added to the cooled solution, and the mixture was stirred for 2 hr. A solution (2 ml) of 2-(6,7-dimethoxy-quinolin-4-yloxy)-5-methoxy-benzaldehyde (compound 26) (138 mg) in tetrahydrofuran was then added to the reaction solution, and the mixture was stirred at -78°C for one hr. A saturated ammonium chloride solution was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-hexane to give [2-(6,7-dimethoxy-quinolin-4-yloxy)-5-methoxy-phenyl]-thiazol-2-yl-methanol (90 mg, yield 52%).

30 [0531] [2-(6,7-Dimethoxy-quinolin-4-yloxy)-5-methoxy-phenyl]-thiazol-2-yl-methanol (90 mg) was dissolved in methanol/methylene chloride (3 ml/9 ml) to prepare a solution, manganese dioxide (90 mg) was added to the solution, and the mixture was stirred at room temperature overnight. The reaction solution was filtered through Celite, water was added to the filtrate, and the mixture was extracted with ethyl acetate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-hexane to give the title compound (65 mg, yield 74%).

40 Compound 193: {1-[2-(6,7-Dimethoxy-quinolin-4-yloxy)-4,5-dimethylphenyl]-ethylidene}-hydrazine

[0532] 1-[2-(6,7-Dimethoxy-quinolin-4-yloxy)-4,5-dimethylphenyl]-1-ethanone (compound 38) (50 mg) was dissolved in ethanol (1.5 ml) to prepare a solution. Hydrazine monohydrate (20 mg) and triethylamine (45 mg) were added to the solution, and the mixture was stirred under reflux for 3 hr. The solvent was removed by distillation under the reduced pressure, water was added to the residue, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure. The residue was purified by thin layer chromatography using hexane-acetone to give the title compound (36 mg, yield 67%).

50 ¹H-NMR (CDCl₃, 400 MHz): δ 1.96 (s, 3H), 2.27 (s, 3H), 2.31 (s, 3H), 4.05 (s, 3H), 4.06 (s, 3H), 5.17 (brs, 2H), 6.38 (d, J = 5.4 Hz, 1H), 6.91 (s, 1H), 7.37 (s, 1H), 7.45 (s, 1H), 7.56 (s, 1H), 8.44 (d, J = 5.4 Hz, 1H)

Compound 194: N-{1-[2-(6,7-Dimethoxy-quinolin-4-yloxy)-4,5-dimethyl-phenyl]-ethylidene}-N'-pyridin-2-yl-hydrazine

55 [0533] 1-[2-(6,7-Dimethoxy-quinolin-4-yloxy)-4,5-dimethylphenyl]-1-ethanone (compound 38) (30 mg) was dissolved in ethanol (1 ml) to prepare a solution. (2-Pyridyl)-hydrazine (28 mg) was added to the solution, and the mixture was stirred at 60°C overnight. Ytterbium triflate (1 mg) was added to the reaction solution, and the mixture was stirred at 60°C for 5 days. The reaction solution was cooled to room temperature, water was then added to the cooled solution,

and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure. The residue was purified by thin layer chromatography using hexane-acetone to give the title compound (13 mg, yield 39%).

¹H-NMR (CDCl₃, 400 MHz): δ 2.08 - 2.16 (m, 3H), 2.28 - 2.59 (m, 6H), 3.99 - 4.07 (m, 6H), 6.38 - 6.40 (m, 1H), 6.67 - 6.75 (m, 1H), 6.92 - 7.57 (m, 6H), 8.01 - 8.09 (m, 2H), 8.41 - 8.49 (m, 1H)

Compound 195: 1-[2-(6,7-Dimethoxy-quinolin-4-yloxy)-4,5-dimethyl-phenyl]-ethanone oxime

[0534] 1-[2-(6,7-Dimethoxy-quinolin-4-yloxy)-4,5-dimethylphenyl]-1-ethanone (compound 38) (30 mg) was dissolved in ethanol (1 ml) to prepare a solution. Hydroxylamine hydrochloride (12 mg) and triethylamine (27 mg) were added to the solution, and the mixture was stirred at room temperature overnight. Further, hydroxylamine hydrochloride (12 mg) and triethylamine (27 mg) were then added to the reaction solution, and the mixture was stirred at room temperature for 5 hr. The solvent was removed by distillation under the reduced pressure, water was added to the residue, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using hexane-acetone to give the title compound (10 mg, yield 31%).

Mass spectrometric value (ESI-MS, m/z): 443 (M+1)⁺

Compound 200: 1-[3-(6,7-Dimethoxy-quinolin-4-yloxy)-naphthalen-2-yl]-ethanone

[0539] Dichloromethane (304 ml) and thionyl chloride (76 ml) were added to 3-hydroxynaphthalene-2-carboxylic acid (5 g), and the mixture was stirred under reflux for 4 hr. The solvent was then removed by distillation under the reduced pressure. Dioxane (200 ml) was added to the residue to prepare a solution. A solution of O,N-dimethylhydroxylamine hydrochloride (7.8 g) in a 2 N aqueous sodium hydroxide solution was added thereto, and the mixture was stirred at room temperature for one hr. Under ice cooling, the reaction solution was acidified by the addition of 4 N hydrochloric acid, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with an aqueous potassium carbonate solution and water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure to give 3-hydroxynaphthalene-2-carboxylic acid methoxymethylamide (660 mg, yield 11%).

[0540] 3-Hydroxynaphthalene-2-carboxylic acid methoxymethylamide (600 mg) was dissolved in tetrahydrofuran (36 ml) to prepare a solution. A solution (9.8 ml) of 0.93 M methylmagnesium bromide in tetrahydrofuran was added thereto at -78°C, temperature of the mixture was raised to room temperature, and the mixture was stirred for 1.5 hr. A saturated aqueous ammonium chloride solution was added to stop the reaction, water was added thereto, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with an aqueous potassium carbonate solution, was washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using hexane-ethyl acetate to give 1-(3-hydroxynaphthalen-2-yl)-ethanone (378 mg, yield 78%).

[0541] 1-(3-Hydroxynaphthalen-2-yl)-ethanone (249 mg), 4-chloro-6,7-dimethoxyquinoline (100 mg), and 4-(N,N-dimethylamino)-pyridine (164 mg) were dissolved in 1,2-dichlorobenzene (5 ml) to prepare a solution which was then stirred at 130°C overnight. The reaction solution was cooled to room temperature, and the solvent was then removed by distillation under the reduced pressure. Water was added to the residue, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure. The residue was purified by thin layer chromatography using hexane-acetone to give the title compound (27 mg, yield 16%).

¹H-NMR (CDCl₃, 400 MHz): δ 2.60 (s, 3H), 4.05 (s, 3H), 4.06 (s, 3H), 6.46 (d, J = 5.2 Hz, 1H), 7.46 (s, 1H), 7.51 - 7.62 (m, 4H), 7.77 (d, J = 8 Hz, 1H), 7.99 (d, J = 7.6 Hz, 1H), 8.44 (s, 1H), 8.49 (d, J = 5.6 Hz, 1H)

Mass spectrometric value (ESI-MS, m/z): 374 (M+1)⁺

Compound 201: Propyl 3-(6,7-dimethoxy-quinolin-4-yloxy)-naphthalene-2-carboxylate

[0542] 2-Hydroxy-naphthalene-3-carboxylic acid (2 g) was dissolved in 1-propanol (10 ml) to prepare a solution. The solution was brought to 0°C, and thionyl chloride (1.16 ml) was gradually added dropwise. The mixture was stirred at 120°C for 2 hr. The reaction solution was cooled to room temperature, and the solvent was removed by distillation under the reduced pressure. Water was then added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using chloroform to give propyl 2-hydroxy-3-naphthoate (2.15 g, yield 88%).

[0543] Propyl 2-hydroxy-3-naphthoate (400 mg), 4-chloro-6,7-dimethoxyquinoline (130 mg), and 4-dimethylaminopyridine (213 mg) were suspended in o-dichlorobenzene (4 ml), and the suspension was stirred at 140°C for 12.5 hr. The reaction solution was cooled to room temperature, water was then added thereto, and the mixture was extracted with chloroform. The chloroform layer was washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-acetone to give the title compound (108 mg, yield 44%).

Mass spectrometric value (ESI-MS, m/z): 418 (M+1)⁺

Compound 202: 6,7-Dimethoxy-4-(2-methyl-pyridin-3-yloxy)-quinoline

[0544] 4-Chloro-6,7-dimethoxyquinoline (245 mg), 2-methyl-3-pyridinol (227 mg), and 4-dimethylaminopyridine (420 mg) were suspended in o-dichlorobenzene (13 ml), and the suspension was stirred at 135°C for 2 days. The reaction solution was cooled to room temperature. The solvent was then removed by distillation under the reduced pressure. The residue was purified by column chromatography using acetone-chloroform to give the title compound (324 mg, yield 100%).

¹H-NMR (CDCl₃, 400 MHz): δ 2.48 (s, 3H), 4.07 (s, 3H), 4.07 (s, 3H), 6.28 (d, J = 5.4 Hz, 1H), 7.27 (m, 1H), 7.42 - 7.46 (m, 2H), 7.56 (d, J = 1.7 Hz, 1H), 8.48 - 8.50 (m, 2H)

Mass spectrometric value (ESI-MS, m/z): 297 (M+1)⁺

Compound 203: 4-(2-Bromo-pyridin-3-yloxy)-6,7-dimethoxyquinoline

[0545] 4-Chloro-6,7-dimethoxyquinoline (226 mg), 2-bromo-3-pyridinol (250 mg), and 4-dimethylaminopyridine (400 mg) were suspended in o-dichlorobenzene (10 ml), and the suspension was stirred at 140°C for 2 hr. The reaction solution was cooled to room temperature, the solvent was then removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-chloroform to give the title compound (21 mg, yield 6%).

¹H-NMR (CDCl₃, 400 MHz): δ 4.06 (s, 3H), 4.06 (s, 3H), 6.38 (d, J = 5.4 Hz, 1H), 7.39 (dd, J = 4.6, 7.8 Hz, 1H), 7.46 (s, 1H), 7.53 (dd, J = 1.7, 8.1 Hz, 1H), 7.54 (s, 1H), 8.37 (dd, J = 1.6, 4.6 Hz, 1H), 8.54 (d, J = 5.1 Hz, 1H)

Mass spectrometric value (ESI-MS, m/z): 361 (M+1)⁺

Compound 204: 4-(2-Cyclopentyl-oxy-pyridin-3-yloxy)-6,7-dimethoxy-quinoline

[0546] 4-Chloro-6,7-dimethoxyquinoline (252 mg), 2,3-dihydroxypyridine (396 mg), and 4-dimethylaminopyridine (400 mg) were suspended in o-dichlorobenzene (13 ml), and the suspension was stirred at 160°C overnight. The reaction solution was cooled to room temperature, the solvent was then removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-chloroform to give 6,7-dimethoxy-4-(2-hydroxy-pyridin-3-yloxy)-quinoline (84 mg, yield 25%).

[0547] 6,7-Dimethoxy-4-(2-hydroxy-pyridin-3-yloxy)-quinoline (21 mg) was dissolved in chloroform (7 ml) to prepare a solution. Potassium carbonate (300 mg) and cyclopentyl bromide (0.2 ml) were added to the solution. The mixture was stirred at room temperature overnight, water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The organic layer was washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-chloroform to give the title compound (14 mg, yield 55%).

Compound 205: 4-(6-Fluoro-pyridin-3-yloxy)-6,7-dimethoxy-quinoline

[0548] 6-Fluoro-3-hydroxypyridine (10 mg), 4-chloro-6,7-dimethoxyquinoline (59 mg), and 4-dimethylaminopyridine (32 mg) were suspended in o-dichlorobenzene (2 ml), and the suspension was stirred at 140°C for 3.5 hr. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using acetone-chloroform to give the title compound (20 mg, yield 76%).

¹H-NMR (CDCl₃, 400 MHz): δ 3.98 (s, 6H), 6.35 (d, J = 5.2 Hz, 1H), 6.99 (dd, J = 8.8 Hz, 3.6 Hz, 1H), 7.36 (s, 1H), 7.44 (s, 1H), 7.56 (m, 1H), 8.09 (s, 1H), 8.46 (d, J = 5.2 Hz, 1H)

Mass spectrometric value (ESI-MS, m/z): 301 (M+1)⁺

Compound 206: 4-(6-Chloro-pyridin-3-yloxy)-6,7-dimethoxy-quinoline

[0549] 2-Chloro-5-hydroxypyridine (100 mg), 4-chloro-6,7-dimethoxyquinoline (861 mg), and 4-dimethylaminopyridine (283 mg) were suspended in o-dichlorobenzene (5 ml), and the suspension was stirred at 140°C for 2 hr. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-hexane to give the title compound (164 mg, yield 67%).

5 Compound 211: 4-(6-Fluoro-2-iodo-pyridin-3-yloxy)-6,7-dimethoxy-quinoline

[0554] 6-Fluoro-3-hydroxypyridine (870 mg) and iodine (9.76 g) were dissolved in a mixed solvent composed of methanol (20 ml) and water (10 ml) to prepare a solution which was then stirred at room temperature for 120 hr. Thereafter, sodium sulfite was added until the solution became transparent. Methanol in the reaction solution was removed under the reduced pressure, water was added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with water and saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-chloroform to give 6-fluoro-2-iodo-pyridin-3-ol (350 mg, yield 19%).

[0555] 6-Fluoro-2-iodo-pyridin-3-ol (20 mg), 4-chloro-6,7-dimethoxyquinoline (56 mg), and 4-dimethylaminopyridine (31 mg) were suspended in o-dichlorobenzene (2 ml), and the suspension was stirred at 140°C for 5 hr. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using acetone-chloroform to give the title compound (2 mg, yield 6%).

25 Compound 212: 6,7-Dimethoxy-4-(6-methyl-2-trimethylsilylethynyl-pyridin-3-yloxy)-quinoline

[0556] 4-[(2-iodo-6-methyl-3-pyridyl)oxy]-6,7-dimethoxy-quinoline (compound 116) (84 mg), trimethylsilylacetylene (39 mg), and bis(triphenylphosphine)palladium(II) chloride (14 mg) were dissolved in tetrahydrofuran (1 ml) to prepare a solution. Diisopropylethylamine (0.2 ml) and copper iodide (3.8 mg) were added to the solution, and the mixture was stirred at room temperature for 18 hr. The reaction solution was filtered, the solvent was then removed by distillation under the reduced pressure, and the residue was purified by column chromatography using chloroform to give the title compound (45 mg, yield 58%).

¹H-NMR (CDCl₃, 400 MHz): δ - 0.17 (s, 9H), 2.62 (s, 3H), 4.06 (s, 3H), 4.06 (s, 3H), 6.33 (d, J = 5.6 Hz, 1H), 7.24 (d, J = 8.4 Hz, 1H), 7.48 (d, J = 8.4 Hz, 1H), 7.50 (s, 1H), 7.60 (s, 1H), 8.51 (d, J = 5.2 Hz, 1H)

Mass spectrometric value (ESI-MS, m/z): 393 (M+1)⁺

35 Compound 213: 3-(6,7-Dimethoxy-quinolin-4-yloxy)-6-methyl-pyridin-2-carbonitrile

[0557] 2-Hydroxymethyl-6-methyl-pyridin-3-ol (1.03 g) was suspended in dichloromethane (50 ml), manganese dioxide (5.53 g) was added to the suspension, and the mixture was stirred at room temperature for 3 days. The reaction solution was filtered, and the solvent was removed by distillation under the reduced pressure. The residue was used in the next reaction without purification.

[0558] The residue was dissolved in N,N-dimethylformamide (40 ml) to prepare a solution. Potassium carbonate (2.35 g) and benzyl chloride (0.8 ml) were added to the solution, and the mixture was stirred at room temperature overnight. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The organic layer was washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using ethyl acetate-hexane to give 3-benzyloxy-6-methyl-pyridine-2-carbaldehyde (881 mg, yield 52%) (2 steps).

[0559] 3-Benzyloxy-6-methyl-pyridine-2-carbaldehyde (100 mg) was dissolved in acetonitrile (5 ml) to prepare a solution. Hydroxylamine hydrochloride (72 mg) and triethylamine (0.25 ml) were added to the solution, and the mixture was stirred at room temperature for one hr. 4-Nitrophthalic anhydride was added to the reaction solution, and the mixture was stirred at 100°C overnight. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The organic layer was washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using ethyl acetate-hexane to give 3-benzyloxy-6-methylpyridine-2-carbonitrile (53 mg, yield 54%).

[0560] Trifluoroacetic acid (1.5 ml) and methanesulfonic acid (0.15 ml) were added to 3-benzyloxy-6-methylpyridine-2-carbonitrile (50 mg) to prepare a solution which was then stirred at room temperature for one hr. The solvent was removed by distillation under the reduced pressure, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The organic layer was washed with an aqueous sodium hydrogencarbonate solution

and water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was used in the next reaction without purification.

[0561] The residue, 4-chloro-6,7-dimethoxyquinoline (94 mg), and 4-dimethylaminopyridine (90 mg) were suspended in o-dichlorobenzene (4 ml), and the suspension was stirred at 140°C for 6 hr. The reaction solution was cooled to room temperature, and the solvent was then removed by distillation under the reduced pressure. The residue was purified by column chromatography using acetone-chloroform to give the title compound (12 mg, yield 17%) (2 steps).

The reaction solution was cooled to room temperature, water was then added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using methanol-chloroform to give 4-(5-chloro-2-hydroxy-pyridin-3-yloxy)-6,7-dimethoxy-quinoline (83 mg, yield 25%).

[0575] 4-(5-Chloro-2-hydroxy-pyridin-3-yloxy)-6,7-dimethoxy-quinoline (39 mg) was suspended in N,N-dimethylformamide (7 ml). Cyclopentyl bromide (0.3 ml) and potassium carbonate (300 mg) were added to the suspension, and the mixture was stirred at room temperature for 2 hr. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The organic layer was washed with an aqueous sodium hydrogencarbonate solution and water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-chloroform to give the title compound (29 mg, yield 62%).

Compound 256: 4-[2-(1,5-Dimethyl-1H-pyrazol-3-yl)-6-methyl-pyridin-3-yloxy]-6,7-dimethoxy-quinoline

[0609] 3-Benzyloxy-6-methyl-pyridine-2-carbaldehyde (452 mg) was dissolved in tetrahydrofuran (15 ml) to prepare a solution. A 1-propynylmagnesium bromide/0.5 M tetrahydrofuran solution (6 ml) was added to the solution at -78°C, and the mixture was stirred at room temperature for 2 hr. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate, and the solvent was removed by distillation under the reduced pressure. The residue was used in the next reaction without purification.

[0610] The residue was dissolved in chloroform (15 ml) to prepare a solution. Manganese dioxide (1.36 g) was added to the solution, and the mixture was stirred at room temperature overnight. The reaction solution was filtered, and the solvent was removed by distillation under the reduced pressure. The residue (563 mg) was used in the next reaction without purification.

[0611] A part (240 mg) of the residue was dissolved in N,N-dimethylformamide (7 ml) to prepare a solution. Hydrazine monohydrate (0.15 ml) was added to the solution, and the mixture was stirred at room temperature overnight. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was used in the next reaction without purification.

[0612] The residue was dissolved in N,N-dimethylformamide (5 ml) to prepare a solution. Potassium carbonate (339 mg) and methyl iodide (0.15 ml) were added to the solution under ice cooling, and the mixture was stirred at room temperature overnight. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was used in the next reaction without purification.

[0613] Trifluoroacetic acid (3 ml) and methanesulfonic acid (0.3 ml) were added to the residue, and the mixture was stirred at room temperature overnight. The solvent was removed by distillation under the reduced pressure. Water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The organic layer was washed with an aqueous sodium hydrogencarbonate solution and water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-chloroform to give 2-(1,5-dimethyl-1H-pyrazol-3-yl)-6-methyl-pyridin-3-ol (60 mg, yield 32%) (5 steps).

[0614] 2-(1,5-Dimethyl-1H-pyrazol-3-yl)-6-methyl-pyridin-3-ol (111 mg), 4-chloro-6,7-dimethoxyquinoline (218 mg), and 4-dimethylaminopyridine (130 mg) were suspended in o-dichlorobenzene (5 ml), and the suspension was stirred at 160°C for 2 days. The reaction solution was cooled to room temperature, and the solvent was then removed by distillation under the reduced pressure. The residue was purified by thin layer chromatography using methanol-chloroform to give the title compound (9 mg, yield 4%).

Compound 257: 4-[2-(2,5-Dimethyl-2H-pyrazol-3-yl)-6-methyl-pyridin-3-yloxy]-6,7-dimethoxy-quinoline

[0615] 3-Benzyloxy-6-methyl-pyridine-2-carbaldehyde (452 mg) was dissolved in tetrahydrofuran (15 ml) to prepare a solution. A 1-propynylmagnesium bromide/0.5 M tetrahydrofuran solution (6 ml) was added to the solution at -78°C, and the mixture was stirred at room temperature for 2 hr. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate, and the ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was used in the next reaction without purification.

[0616] The residue was dissolved in chloroform (15 ml) to prepare a solution. Manganese dioxide (1.36 g) was added to the solution, and the mixture was stirred at room temperature overnight. The reaction solution was filtered, and the solvent was removed by distillation under the reduced pressure. The residue (563 mg) was used in the next reaction without purification.

[0617] A part (240 mg) of the residue was dissolved in N,N-dimethylformamide (7 ml) to prepare a solution. Hydrazine monohydrate (0.15 ml) was added to the solution, and the mixture was stirred at room temperature overnight. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was used in the next reaction without purification.

[0618] The residue was dissolved in N,N-dimethylformamide (5 ml) to prepare a solution. Potassium carbonate (339 mg) and methyl iodide (0.15 ml) were added to the solution under ice cooling, and the mixture was stirred at room temperature overnight. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was used in the next reaction without purification.

[0619] Trifluoroacetic acid (3 ml) and methanesulfonic acid (0.3 ml) were added to the residue, and the mixture was stirred at room temperature overnight. The solvent was removed by distillation under the reduced pressure. Water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The organic layer was washed with an aqueous sodium hydrogencarbonate solution and was washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-chloroform to give 2-(2,5-dimethyl-2H-pyrazol-3-yl)-6-methyl-pyridin-3-ol (38 mg, yield 21%) (5 steps).

[0620] 2-(2,5-Dimethyl-2H-pyrazol-3-yl)-6-methyl-pyridin-3-ol (33 mg), 4-chloro-6,7-dimethoxyquinoline (109 mg), and 4-dimethylaminopyridine (66 mg) were dissolved in dimethyl sulfoxide (5 ml) to prepare a solution. Cesium carbonate (165 mg) was added to the solution, and the mixture was stirred at 140°C for 4 hr. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using methanol-chloroform to give the title compound (15 mg, yield 23%).

Compound 260: 4-[2-(4,5-Dimethylthiazol-2-yl)-5,6-dimethyl-pyridin-3-yloxy]-6,7-dimethoxy-quinoline

[0627] 4,5-Dimethylthiazole (1.0 g) was dissolved in tetrahydrofuran (40 ml) under an argon atmosphere to prepare a solution. A 1.6M hexane solution (5.6 ml) of n-butyllithium was added dropwise at -78°C, and the mixture was then stirred at -78°C for 30 min. A solution of 4,5-dimethylfurfural (1 g) in tetrahydrofuran (20 ml) was added dropwise thereto, and the temperature of the mixture was raised to room temperature with stirring. Water was added to the reaction solution to stop the reaction. The solvent was removed by distillation under the reduced pressure, water was added to the residue, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using hexane-acetone to give (4,5-dimethylfuran-2-yl)-(4,5-dimethylthiazol-2-yl)-methanol (945 mg, yield 50%).

[0628] (4,5-Dimethylfuran-2-yl)-(4,5-dimethylthiazol-2-yl)-methanol (945 mg) was dissolved in chloroform (20 ml) to prepare a solution. Manganese dioxide (3.5 g) was added to the solution, and the mixture was stirred at room temperature overnight. The reaction solution was filtered through Celite, and the solvent was removed from the filtrate by distillation under the reduced pressure to give (4,5-dimethylfuran-2-yl)-(4,5-dimethylthiazol-2-yl)-methanone (910 mg, yield 97%).

[0629] (4,5-Dimethylfuran-2-yl)-(4,5-dimethylthiazol-2-yl)-methanone (910 mg), methanol (7 ml), and 8 ml of a 28% aqueous ammonia solution were placed in a sealed tube, and the mixture was stirred at 160°C overnight. The reaction solution was cooled to room temperature, the solvent was then removed by distillation under the reduced pressure, and the residue was purified by column chromatography using hexane-ethyl acetate to give 5,6-dimethyl-2-(4,5-dimethylthiazol-2-yl)-pyridin-3-ol (782 mg, yield 86%).

[0630] Dimethyl sulfoxide (2 ml) was added to 5,6-dimethyl-2-(4,5-dimethylthiazol-2-yl)-pyridin-3-ol (50 mg), 4-chloro-6,7-dimethoxyquinoline (143 mg), cesium carbonate (209 mg), and 4-(N,N-dimethylamino)-pyridine (78 mg), and the mixture was stirred at 140°C overnight. The reaction solution was cooled to room temperature, water was then added to the cooled solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using hexane-acetone to give the title compound (7.7 mg, yield 9%).

Compound 261: 3-(6,7-Dimethoxy-quinolin-4-yloxy)-6-methyl-[2,2']-bipyridine

[0631] N,N-Dimethylformamide (1.2 ml) was added to 4-(2-iodo-6-methyl-pyridin-3-yloxy)-6,7-dimethoxy-quinoline (compound 116) (50 mg), tetrakis(triphenylphosphine) palladium (14 mg), tri-n-butyl-(2-pyridyl)-tin (65 mg), and cesium fluoride (36 mg) under an argon atmosphere, and the mixture was stirred at 70°C for three nights. The reaction solution was cooled to room temperature, water was then added thereto, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate.

[0632] Likewise, N,N-dimethylformamide (1.2 ml) was added to 4-(2-iodo-6-methyl-pyridin-3-yloxy)-6,7-dimethoxy-quinoline (compound 116) (50 mg), tris(dibenzylideneacetone) (chloroform)dipalladium(0) (6.1 mg), (±)-2,2'-(diphenylphosphino)-binaphthyl (3.7 mg), tri-n-butyl-(2-pyridyl)-tin (65 mg), and cesium fluoride (36 mg) under an argon atmosphere, and the mixture was stirred at 70°C for 3 nights. The reaction solution was cooled to room temperature, water was then added thereto, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate.

[0633] The above two ethyl acetate layers were combined, and the solvent was removed by distillation under the reduced pressure. The residue was purified by thin layer chromatography using ether-methanol to give the title compound (14 mg, yield 32%).

Compound 266: 3-(6,7-Dimethoxy-quinolin-4-yloxy)-6-methylsulfanyl-[2,2']bipyridine

[0639] 6-Fluoro-2-iodo-pyridin-3-ol (50 mg) was dissolved in acetonitrile (2 ml) to prepare a solution. Methyl iodide (148 mg) and potassium carbonate (87 mg) were added to the solution, and the mixture was stirred at room temperature overnight. The solvent was removed by distillation under the reduced pressure, water was then added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with water and was dried over anhydrous magnesium sulfate, the solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform to give 6-fluoro-2-iodo-3-methoxypyridine (52 mg, yield 100%).

[0640] 6-Fluoro-2-iodo-3-methoxypyridine (84 mg), tetrakis(triphenylphosphine) palladium (0) (38 mg), and copper(II) oxide (53 mg) were suspended in N,N-dimethylformamide (2 ml). 2-Tributylstannylpyridine (244 mg) was added to the suspension, and the mixture was stirred at 100°C overnight. The reaction solution was cooled to room temperature. The reaction solution was then filtered, the solvent was removed from the filtrate by distillation under the reduced pressure. Water was then added to the residue, and the mixture was extracted with dichloromethane. The dichloromethane layer was washed with water and saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give 6-fluoro-3-methoxy-[2,2']bipyridine (12 mg, yield 18%).

[0641] 6-Fluoro-3-methoxy-[2,2']bipyridine (12 mg) and sodium thiomethoxide (41 mg) were suspended in N,N-dimethylformamide (1.5 ml), and the suspension was stirred at 160°C overnight. The reaction solution was cooled to room temperature, the reaction solution was then filtered, and the solvent was removed from the filtrate by distillation under the reduced pressure. The residue was purified by thin layer chromatography using acetone-chloroform to give 6-methylsulfanyl-[2,2']bipyridin-3-ol (6 mg, yield 47%).

[0642] 6-Methylsulfanyl-[2,2']bipyridin-3-ol (6 mg), 4-chloro-6,7-dimethoxyquinoline (18 mg), 4-dimethylaminopyridine (10 mg), and cesium carbonate (27 mg) were suspended in N,N-dimethyl sulfoxide (1 ml), and the suspension was stirred at 140°C overnight. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using acetone-hexane to give the title compound (1 mg, yield 8%).

Compound 267: 3-(6,7-Dimethoxy-quinolin-4-yloxy)-6-methylsulfanyl-[2,3']bipyridine

[0643] 6-Fluoro-2-iodo-3-methoxypyridine (52 mg), tetrakis(triphenylphosphine) palladium(0) (24 mg), and 3-pyridineboronic acid (76 mg) were suspended in a mixed solvent composed of N,N-dimethylformamide (0.75 ml) and a 2 N aqueous potassium carbonate solution (0.75 ml), and the suspension was stirred at 80°C for 4 hr. The reaction solution was cooled to room temperature, the reaction solution was then filtered, and the solvent was removed from the filtrate by distillation under the reduced pressure. Water was then added to the residue, and the mixture was extracted with dichloromethane. The dichloromethane layer was washed with water and saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using acetone-chloroform to give 6-fluoro-3-methoxy-[2,3']bipyridine (31 mg, yield 72%).

[0644] 6-Fluoro-3-methoxy-[2,3']bipyridine (30 mg) and sodium thiomethoxide (103 mg) were suspended in N,N-dimethylformamide (1.5 ml), and the suspension was stirred at 160°C for 4 hr. The reaction solution was cooled to room temperature, the reaction solution was filtered, and the solvent was removed from the filtrate by distillation under the reduced pressure. The residue was purified by thin layer chromatography using chloroform-methanol to give 6-methylsulfanyl-[2,3']bipyridin-3-ol (13 mg, yield 45%).

[0645] 6-Methylsulfanyl-[2,3']bipyridin-3-ol (13 mg), 4-chloro-6,7-dimethoxyquinoline (46 mg), and 4-dimethylaminopyridine (29 mg) were suspended in o-dichlorobenzene (2 ml), and the suspension was stirred at 140°C for 4 hr. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using acetone-chloroform to give the title compound (25 mg, yield 91%).

Compound 268: 4-(5,6-Dimethyl-2-phenyl-pyridin-3-yloxy)-6,7-dimethoxy-quinoline

[0646] Carbon disulfide (35 ml) was added to benzoyl chloride (7.3 g) and anhydrous aluminum chloride (7.0 g) under an argon atmosphere, and a solution of 2,3-dimethylfuran (5.0 g) in carbon disulfide (35 ml) was added dropwise thereto at 10°C. The mixture was then stirred for 30 min while raising the temperature to room temperature. 10% Hydrochloric acid (200 ml) was added to the reaction solution, and the mixture was extracted with dichloromethane. The dichloromethane layer was then washed with water and a 5% aqueous sodium bicarbonate solution and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using hexane-ethyl acetate to give (4,5-dimethylfuran-2-yl)-phenyl-methanone (2.5 g, yield 25%).

[0647] (4,5-Dimethylfuran-2-yl)-phenyl-methanone (1 g) and ammonium acetate (910 mg) were placed in a sealed tube, and the mixture was stirred at 250°C for 10 hr. The reaction solution was cooled to room temperature, the solvent was then removed by distillation under the reduced pressure, and the residue was purified by column chromatography using hexane-ethyl acetate to give 5,6-dimethyl-2-phenyl-pyridin-3-ol (160 g, yield 16%).

[0648] 1,2-Dichlorobenzene (4.5 ml) was added to 5,6-dimethyl-2-phenyl-pyridin-3-ol (267 mg), 4-chloro-6,7-dimethoxyquinoline (100 mg), and 4-(N,N-dimethylamino)-pyridine (164 mg), and the mixture was stirred at 140°C for 8 hr. The reaction solution was cooled to room temperature, and the solvent was then removed by distillation under the reduced pressure. Water was added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using hexane-acetone to give the title compound (159 mg, yield 92%).

Compound 269: 3-(6,7-Dimethoxy-quinolin-4-yloxy)-5,6-dimethyl-[2,2']bipyridine

[0649] 2,3-Dimethylfuran (5 g) was dissolved in diethyl ether (75 ml) under an argon atmosphere. A 1.6 M hexane

solution (35.7 ml) of n-butyllithium was added dropwise thereto at 0°C, and the mixture was stirred under reflux for 2.5 hr. Thereafter, the reaction solution was cooled to -78°C, a solution of 2-cyanopyridine (6.0 g) in diethyl ether (20 ml) was added dropwise thereto, and the mixture was stirred at room temperature for 3 hr. The reaction solution was poured into ice to stop the reaction. The reaction solution was adjusted to pH 5 by the addition of 2 M hydrochloric acid and was then extracted with chloroform. The chloroform layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using hexane-ethyl acetate to give (4,5-dimethylfuran-2-yl)-(2-pyridyl)-methanone (1.8 g, yield 17%).

[0650] (4,5-Dimethylfuran-2-yl)-(2-pyridyl)-methanone (1.6 g), methanol (15 ml), and a 28% aqueous ammonia solution (15 ml) were placed in a sealed tube, and the mixture was stirred at 160°C overnight. The reaction solution was cooled to room temperature, the solvent was then removed by distillation under the reduced pressure, and the residue was purified by column chromatography using hexane-ethyl acetate to give 5,6-dimethyl-[2,2']-bipyridin-3-ol (1.2 g, yield 75%).

[0651] Dimethyl sulfoxide (1.5 ml) was added to 5,6-dimethyl-[2,2']-bipyridin-3-ol (30 mg), 4-chloro-6,7-dimethoxyquinoline (101 mg), and cesium carbonate (147 mg), and the mixture was stirred at 130°C for 7 hr. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using hexane-acetone to give the title compound (12 mg, yield 20%).

Compound 271: 3-(6,7-Dimethoxy-quinolin-4-yloxy)-5,6,6'-trimethyl-[2,2']bipyridine

[0655] 2-Bromo-6-picoline (1.5 g) was dissolved in tetrahydrofuran (40 ml) under an argon atmosphere to prepare a solution. A 1.6 M hexane solution (5.6 ml) of n-butyllithium was added dropwise to the solution at -78°C, and the mixture was then stirred at -78°C for 30 min. A solution of 4,5-dimethylfurfural (1 g) in tetrahydrofuran (20 ml) was added dropwise thereto, and the temperature of the mixture was raised to room temperature while stirring. Water was added to the reaction solution to stop the reaction, and the solvent was removed by distillation under the reduced pressure. Water was added to the residue, and the mixture was extracted with ethyl acetate. The ethyl acetate layer

was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using hexane-acetone to give (4,5-dimethylfuran-2-yl)-(6-methyl-pyridin-2-yl)-methanol (1.4 g, yield 74%).

[0656] (4,5-Dimethylfuran-2-yl)-(6-methyl-pyridin-2-yl)-methanol (1.4 g) was dissolved in chloroform (30 ml) to prepare a solution. Manganese dioxide (5.7 g) was added to the solution, and the mixture was stirred at room temperature overnight. Further, manganese dioxide (1.8 g) was then added thereto, and the mixture was stirred overnight. The reaction solution was filtered through Celite. The solvent was removed from the filtrate by distillation under the reduced pressure to give (4,5-dimethylfuran-2-yl)-(6-methyl-pyridin-2-yl)-methanone (815 mg, yield 58%).

[0657] (4,5-Dimethylfuran-2-yl)-(6-methyl-pyridin-2-yl)-methanone (810 mg), methanol (7 ml), and a 28% aqueous ammonia solution (7 ml) were placed in a sealed tube, and the mixture was stirred at 160°C overnight. The reaction solution was cooled to room temperature, the solvent was then removed by distillation under the reduced pressure, and the residue was purified by column chromatography using hexane-ethyl acetate to give 5,6,6'-trimethyl-[2,2']bipyridin-3-ol (753 mg, yield 93%).

[0658] Dimethyl sulfoxide (2 ml) was added to 5,6,6'-trimethyl-[2,2']bipyridin-3-ol (50 mg), 4-chloro-6,7-dimethoxyquinoline (157 mg), cesium carbonate (229 mg), and 4-(N,N-dimethylamino)-pyridine (86 mg), and the mixture was stirred at 140°C overnight. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. Compound 277: [3-(6,7-Dimethoxy-quinolin-4-yloxy)-quinolin-2-ylmethyl]-diisopropyl-amine

[0672] 6,7-Dimethoxy-4-(2-methyl-quinolin-3-yloxy)-quinoline (compound 276) (108 mg) was dissolved in tetrahydrofuran (5 ml) to prepare a solution. A lithiumdiisopropylamide/1.8 M heptane-tetrahydrofuran-ethylbenzene solution (0.3 ml) was added to the solution at -78°C, and the mixture was stirred for 10 min. N-Bromosuccinimide (180 mg) was added to the reaction solution, and the mixture was stirred at room temperature for 5 hr. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using methanol-chloroform to give the title compound (23 mg, yield 16%).

Compound 278: 1-[3-(6,7-Dimethoxy-quinolin-4-yloxy)-quinolin-2-yl]-ethanone

[0673] A mixture of 2-nitrobenzoyl chloride (500 mg) with 4-trimethylsilyloxy-pent-3-en-2-one (540 mg) was stirred at 140°C for 5 min. The reaction solution was cooled to room temperature and was then purified by column chromatography using acetone-hexane to give 3-(2-nitro-benzoyl)-pentane-2,4-dione (143 mg, yield 20%).

[0674] 3-(2-Nitro-benzoyl)-pentane-2,4-dione (143 mg) was suspended in a 20% aqueous potassium hydroxide solution (10 ml), and the suspension was heated under reflux for 45 min. The reaction solution was cooled to room temperature, was then neutralized with a 1 N aqueous hydrochloric acid solution, and was extracted with chloroform. The chloroform layer was washed with water and saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure. The residue was purified by thin layer chromatography using chloroform to give 2-acetyl-3-quinolinol (22 mg, yield 21%).

[0675] 2-Acetyl-3-quinolinol (22 mg), 4-chloro-6,7-dimethoxyquinoline (54 mg), and 4-dimethylaminopyridine (88 mg) were suspended in o-dichlorobenzene (5 ml), and the suspension was stirred at 130°C overnight. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using acetone-hexane to give the title compound (6 mg, yield 13%).

5 Compound 279: [3-(6,7-Dimethoxy-quinolin-4-yloxy)-quinolin-2-yl]-phenyl-methanone

[0676] Ethyl 3-hydroxy-2-methyl-quinoline-4-carboxylate (2.10 g) was suspended in o-dichlorobenzene (50 ml), and the mixture was stirred at 150°C overnight and was further stirred at 160°C for one day. The reaction solution was cooled to room temperature, and the solvent was then removed by distillation under the reduced pressure. The residue
10 was purified by column chromatography using methanol-chloroform to give 3-hydroxy-2-methyl-quinoline (976 mg, yield 60%).

[0677] 3-Hydroxy-2-methyl-quinoline (0.46 g) was suspended in xylene (30 ml), zylene dioxide (2.55 g) was added to the suspension, and the mixture was stirred at 130°C for 30 min. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over
15 anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-chloroform to give 3-hydroxy-quinoline-2-carbaldehyde (124 mg, yield 25%).

[0678] 3-Hydroxy-quinoline-2-carbaldehyde (124 mg) was dissolved in tetrahydrofuran (20 ml) to prepare a solution. A phenylmagnesium bromide/1.04 M tetrahydrofuran solution (4 ml) was added to the solution under ice cooling, and
20 the mixture was stirred at room temperature for one hr. Water was added to the reaction solution, the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was used in the next reaction without purification.

[0679] The residue was dissolved in chloroform (15 ml), manganese dioxide (2.56 g) was added to the solution, and the mixture was stirred at room temperature overnight. The reaction solution was filtered, the solvent was removed by
25 distillation under the reduced pressure, and the residue was purified by column chromatography using ethyl acetate-hexane to give (3-hydroxy-quinolin-2-yl)-phenyl-methanone (28 mg, yield 16%) (2 steps).

[0680] (3-Hydroxy-quinolin-2-yl)-phenyl-methanone (27 mg), 4-chloro-6,7-dimethoxyquinoline (120 mg), and 4-dimethylaminopyridine (147 mg) were suspended in o-dichlorobenzene (5 ml), and the suspension was stirred at
30 150°C for 2 hr. The reaction solution was cooled to room temperature, and the solvent was removed by distillation under the reduced pressure. Water was then added to the residue, and the mixture was extracted with ethyl acetate. The organic layer was washed with water and was dried over anhydrous sodium sulfate, the solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using acetone-chloroform to give the title compound (20 mg, yield 42%).

40 Compound 280: 4-(2-Cyclopentyloxy-quinolin-3-yloxy)-6,7-dimethoxy-quinoline

[0681] 4-Chloro-6,7-dimethoxyquinoline (106 mg), 2,3-dihydroxyquinoline (50 mg), and 4-dimethylaminopyridine (124 mg) were suspended in o-dichlorobenzene (5 ml), and the suspension was stirred at 150°C for 8 hr. The reaction solution was cooled to room temperature, water was then added thereto, and the mixture was extracted with ethyl
45 acetate. The organic layer was washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using methanol-chloroform to give 6,7-dimethoxy-4-(2-hydroxy-quinolin-3-yloxy)-quinoline (40 mg, yield 37%).

[0682] 6,7-Dimethoxy-4-(2-hydroxy-quinolin-3-yloxy)-quinoline (19 mg) was dissolved in N,N-dimethylformamide (4 ml) to prepare a solution. Potassium carbonate (180 mg) and cyclopentyl bromide (0.1 ml) were added to the solution, and the mixture was stirred at room temperature overnight. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The organic layer was washed with water and was dried over anhydrous sodium
50 sulfate, and the solvent was removed by distillation under the reduced pressure. The residue was purified by column chromatography using acetone-chloroform to give the title compound (14 mg, yield 60%).

Compound 281: 4-(2-Bromo-quinolin-3-yloxy)-6,7-dimethoxy-quinoline

[0683] 2-Aminobenzaldehyde (650 mg) was dissolved in dichloromethane (20 ml) to prepare a solution. Chloroacetyl chloride (728 mg) was added to the solution, and the mixture was stirred at room temperature overnight. Water was added thereto, and the mixture was extracted with dichloromethane. The dichloromethane layer was washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using chloroform to give 2-chloro-N-(2-formyl-phenyl)-acetamide (1.05 g, yield 99%).

[0684] 2-Chloro-N-(2-formyl-phenyl)-acetamide (960 mg) was dissolved in a mixed solvent composed of water (60 ml) and methanol (24 ml) at 100°C. A 10% aqueous potassium hydroxide solution (12 ml) was added dropwise to the solution and was then heated under reflux for one hr. The reaction solution was cooled to room temperature, methanol was then removed under the reduced pressure, and the residue was neutralized with a 1 N aqueous hydrochloric acid solution. The precipitate was collected by filtration, was washed with ethyl acetate, and was dried under the reduced pressure to give 2,3-dihydroxyquinoline (450 mg, yield 26%).

[0685] 2,3-Dihydroxyquinoline (450 mg), 4-chloro-6,7-dimethoxyquinoline (575 mg), and 4-dimethylaminopyridine (472 mg) were suspended in o-dichlorobenzene (12 ml), and the mixture was stirred at 135°C for 5.5 hr. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure. The residue was purified by column chromatography using acetone-chloroform to give 3-(6,7-dimethoxy-quinolin-4-yloxy)-quinolin-2-ol (344 mg, yield 77%).

[0686] 3-(6,7-Dimethoxy-quinolin-4-yloxy)-quinolin-2-ol (50 mg), diphosphorus pentaoxide (51 mg), and tetrabutylammonium bromide (69 mg) were suspended in o-dichlorobenzene (1 ml), and the suspension was stirred at 140°C for 1.5 hr. The reaction solution was cooled to room temperature. A 10% aqueous sodium hydrogencarbonate solution was then added to the reaction solution, and the mixture was extracted with chloroform. The chloroform layer was then washed with water and saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (5 mg, yield 8%).

Compound 290: 4-[2-(5-Chloro-4-methyl-thiophen-2-yl)-quinolin-3-yloxy]-6,7-dimethoxy-quinoline

[0697] 2-Aminobenzaldehyde (184 mg) and 2-bromo-1-(4-bromo-5-chloro-thiophen-2-yl)-ethanone (442 mg) were dissolved in methanol (10 ml) to prepare a solution. Sodium hydroxide (210 mg) and water (5 ml) were added to the solution, and the mixture was stirred at room temperature for 2 days. Dilute hydrochloric acid was added to the reaction solution, and the mixture was extracted with chloroform. The organic layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was used in the next reaction without further purification.

[0698] The residue, 4-chloro-6,7-dimethoxyquinoline (174 mg), and 4-dimethylaminopyridine (102 mg) were suspended in *o*-dichlorobenzene (7 ml), and the suspension was stirred at 140°C for 4 hr and further at 160°C for 3 hr. The reaction solution was cooled to room temperature, and the solvent was then removed by distillation under the reduced pressure. The residue was purified by thin layer chromatography using acetone-chloroform to give 4-[2-(4-bromo-5-chloro-thiophen-2-yl)-quinolin-3-yloxy]-6,7-dimethoxy-quinoline (32 mg, yield 4%) (2 steps).

[0699] 4-[2-(4-Bromo-5-chloro-thiophen-2-yl)-quinolin-3-yloxy]-6,7-dimethoxy-quinoline (20 mg) was dissolved in di-

oxane (3 ml) to prepare a solution. Tetrakis(triphenyl)phosphine palladium (25 mg), methylboronic acid (0.1 ml), water (0.3 ml), and cesium carbonate (182 mg) were added to the solution, and the mixture was stirred at 100°C for 4 days. The reaction solution was filtered, and the solvent was removed by distillation under the reduced pressure. The residue was purified by thin layer chromatography using methanol-chloroform to give the title compound (13 mg, yield 76%).

Compound 296: 6,7-Dimethoxy-4-(7-methyl-quinolin-6-yloxy)-quinoline

[0708] 4-Methoxy-3-methylaniline (45.2 g) was dissolved in isopropanol (100 ml) to prepare a solution. Diethyl ethoxymethylenemalonate (71.3 g) was added to the solution, and the mixture was heated under reflux for 5 min. The reaction solution was cooled, and the solvent was then removed by distillation under the reduced pressure. The residue was washed with ether-hexane to give diethyl 2-[(4-methoxy-3-methyl-phenylamino)-methylene]-malonate (76.9 g, yield 76%).

[0709] Diethyl 2-[(4-methoxy-3-methyl-phenylamino)-methylene]-malonate (73.9 g) was dissolved in diphenyl ether (200 ml) to prepare a solution which was then stirred at 220°C for 2 hr. The reaction solution was cooled to room temperature, hexane was then added to the reaction solution, and the precipitated crystal was collected by filtration to give ethyl 6-methoxy-7-methyl-4-oxo-1,4-dihydro-quinoline-3-carboxylate (25.5 g, yield 35%).

[0710] Ethyl 6-methoxy-7-methyl-4-oxo-1,4-dihydro-quinoline-3-carboxylate (25.5 g) was suspended in a 2 M aqueous sodium hydroxide solution (250 ml), and the mixture was heated under reflux for 4 hr. The reaction solution was cooled to room temperature, the aqueous layer was then washed with chloroform and was neutralized with dilute hydrochloric acid. The precipitated crystal was collected by filtration and was washed with water, isopropanol, and hexane in that order to give 6-methoxy-7-methyl-4-oxo-1,4-dihydro-quinoline-3-carboxylic acid (22.1 g, yield 98%).

[0711] 6-Methoxy-7-methyl-4-oxo-1,4-dihydro-quinoline-3-carboxylic acid (22 g) was suspended in diphenyl ether (200 ml), and the suspension was heated under reflux overnight. The reaction solution was cooled to room temperature, hexane was then added to the reaction solution, and the precipitated crystal was collected by filtration to give 6-methoxy-7-methyl-1H-quinolin-4-one (16.6 g, yield 93%).

[0712] 6-Methoxy-7-methyl-1H-quinolin-4-one (73.9 g) was added to phosphorus oxychloride (160 ml), and the mixture was heated under reflux for 2 hr. The reaction solution was cooled to room temperature, and the solvent was then removed by distillation under the reduced pressure. Chloroform and water were added to the reaction solution, and the aqueous layer was neutralized with an aqueous potassium hydroxide solution. The organic layer was washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, hexane was added to the residue, and the precipitated crystal was collected by filtration to give 4-chloro-6-methoxy-7-methyl-quinoline (12.7 g, yield 71%).

[0713] 4-Chloro-6-methoxy-7-methyl-quinoline (10.8 g) was dissolved in diisopropylethylamine/IMS (7.4 g/100 ml), 5% palladium carbon (0.5 g) was added to the solution, and the mixture was stirred under a hydrogen gas atmosphere at room temperature overnight. The reaction solution was filtered, and the solvent was then removed by distillation

under the reduced pressure to give 6-methoxy-7-methyl-quinoline (3 g, yield 33%).

[0714] 6-Methoxy-7-methyl-quinoline (3 g) was added to an aqueous bromic acid solution (30 ml), and the mixture was heated under reflux for 7 hr. The reaction solution was cooled to room temperature, the aqueous layer was then neutralized with an aqueous sodium hydroxide solution and an aqueous sodium hydrogencarbonate solution. The organic layer was extracted with ether, the solvent was removed by distillation under the reduced pressure, and the residue was washed with cooled ether to give 6-hydroxy-7-methylquinoline (1.3 g, yield 47%).

[0715] 6-Hydroxy-7-methylquinoline (180 mg), 4-chloro-6,7-dimethoxyquinoline (126 mg), and 4-dimethylaminopyridine (69 mg) were suspended in o-dichlorobenzene (3 ml), and the suspension was stirred at 140°C for 3 hr. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using acetone-chloroform to give the title compound (36 mg, yield 60%).

Compound 299: 6,7-Dimethoxy-4-(7-phenyl-quinolin-6-yloxy)-quinoline

[0720] Trifluoroacetic acid (15 ml) and methanesulfonic acid (1.5 ml) were added to 7-benzyloxy-4-chloro-6-methoxy-

quinoline (1.02 g), and the mixture was stirred at room temperature for one hr. The solvent was removed by distillation under the reduced pressure, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The organic layer was washed with an aqueous sodium hydrogencarbonate solution and water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue (0.8 g) was used in the next reaction without purification.

[0721] A part (545 g) of the residue was suspended in triethylamine/dichloromethane (5 ml/20 ml), trifluoromethanesulfonic anhydride (2 ml) was added to the suspension under ice cooling, and the mixture was stirred at room temperature for 2 hr. The solvent was removed by distillation under the reduced pressure. Water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The organic layer was washed with an aqueous sodium hydrogencarbonate solution and water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using ethyl acetate-hexane to give 4-chloro-6-methoxy-quinolin-7-yl trifluoro-methanesulfonate (228 mg, yield 29%) (2 steps).

[0722] 4-Chloro-6-methoxy-quinolin-7-yl trifluoro-methanesulfonate (114 mg), phenylboronic acid (150 mg), and tetrakis(triphenylphosphine) palladium (25 mg) were dissolved in N,N-dimethylformamide (3 ml), a 2 M aqueous potassium carbonate solution (0.3 ml) was added to the reaction system, and the mixture was stirred at 80°C for one hr. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate, and the ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was used in the next reaction without purification.

[0723] The residue was dissolved in triethylamine/N,N-dimethylformamide (2 ml/10 ml) to prepare a solution, palladium hydroxide (0.83 g) was added to the solution, and the mixture was stirred at room temperature under a hydrogen gas atmosphere overnight. The reaction solution was filtered, and the solvent was then removed by distillation under the reduced pressure. Water was added to the residue, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using ethyl acetate-hexane to give 6-methoxy-7-phenyl-1,2,3,4-tetrahydro-quinoline (63 mg, yield 79%).

[0724] 6-Methoxy-7-phenyl-1,2,3,4-tetrahydro-quinoline (62 mg) was dissolved in o-dichlorobenzene (20 ml) to prepare a solution. 2,3-Dichloro-5,6-dicyano-1,4-benzoquinone (227 mg) was added to the solution, and the mixture was stirred at 120°C for 30 min. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was used in the next reaction without purification.

[0725] The residue was dissolved in dichloromethane (3 ml) to prepare a solution, a boron tribromide/1 M dichloromethane solution (0.3 ml) was added to the solution under ice cooling, and the mixture was stirred for 2 days. The solvent was removed by distillation under the reduced pressure, water was then added to the residue, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was used in the next reaction without purification.

[0726] The residue, 4-chloro-6,7-dimethoxyquinoline (62 mg), and 4-dimethylaminopyridine (49 mg) were suspended in o-dichlorobenzene (2 ml), and the suspension was stirred at 150°C for 4 hr. The reaction solution was cooled to room temperature, and the solvent was removed by distillation under the reduced pressure. The residue was purified by thin layer chromatography using acetone-chloroform to give the title compound (24 mg, yield 23%) (3 steps).

Compound 300: 6,7-Dimethoxy-4-(7-methyl-isoquinolin-6-yloxy)-quinoline

[0727] 4-Methoxy-3-methylbenzaldehyde (3.00 g) was dissolved in benzene (30 ml) to prepare a solution. 2,2-Dimethoxy-ethylamine (2.10 g) was added to the solution, and the mixture was heated under reflux overnight. The solvent was removed by distillation under the reduced pressure, the residue was then dissolved in tetrahydrofuran (30 ml), and the mixture was cooled to -10°C. Ethyl chloroformate (2.17 g) and trimethyl phosphite (2.97 g) were added thereto, and mixture was stirred at room temperature overnight. The solvent was removed by distillation under the reduced pressure, the residue was then dissolved in dichloromethane (30 ml), titanium tetrachloride (22.7 g) was added to the solution, and the mixture was heated under reflux for 36 hr. The reaction solution was cooled to room temperature, was then neutralized with a 1 N aqueous sodium hydroxide solution, and was extracted with 3 N hydrochloric acid. The aqueous layer was made basic by the addition of a 3 N aqueous sodium hydroxide solution and was then extracted with dichloromethane. The solvent was removed by distillation under the reduced pressure to give 6-methoxy-7-methylisoquinoline (764 mg, yield 22%).

[0728] 6-Methoxy-7-methylisoquinoline (239 mg) and sodium thiomethoxide (1.58 g) were suspended in N,N-dimethylformamide (12 ml), and the suspension was stirred at 160°C for 2 hr. The reaction solution was cooled to room temperature, the reaction solution was then filtered, and the solvent was removed from the filtrate by distillation under the reduced pressure. The residue was purified by thin layer chromatography using chloroform-methanol to give 6-hydroxy-7-methylisoquinoline (21 mg, yield 1%).

[0729] 6-Hydroxy-7-methylisoquinoline (21 mg), 4-chloro-6,7-dimethoxyquinoline (81 mg), and 4-dimethylaminopyridine (44 mg) were suspended in o-dichlorobenzene (2.5 ml), and the suspension was stirred at 140°C for 6 hr. The reaction solution was cooled to room temperature, water was then added to reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using acetone-chloroform to give the title compound (24 mg, yield 58%).

Compound 301: 4-(7-Bromo-isoquinolin-6-yloxy)-6,7-dimethoxy-quinoline

[0730] 3-Bromo-4-methoxybenzaldehyde (10.0 g) was dissolved in benzene (100 ml) to prepare a solution. 2,2-Dimethoxy-ethylamine (4.89 g) was added to the solution, and the mixture was heated under reflux overnight. The solvent was removed by distillation under the reduced pressure, and the residue was then dissolved in tetrahydrofuran (100 ml) to prepare a solution which was then cooled to -10°C. Ethyl chloroformate (5.05 g) and trimethyl phosphite (6.92 g) were added thereto, and the mixture was stirred at room temperature overnight. The solvent was removed by distillation under the reduced pressure, the residue was then dissolved in dichloromethane (100 ml) to prepare a solution. Titanium tetrachloride (53.0 g) was added to the solution, and the mixture was heated under reflux for 36 hr. The reaction solution was cooled to room temperature, was then neutralized with a 1 N aqueous sodium hydroxide solution, and was extracted with 3 N hydrochloric acid. The aqueous layer was made basic with a 3 N aqueous sodium hydroxide solution, was then extracted with dichloromethane, and the solvent was removed by distillation under the reduced pressure to give 7-bromo-6-methoxyisoquinoline (2.90 g, yield 26%).

[0731] 7-Bromo-6-methoxyisoquinoline (50 mg) and sodium thiomethoxide (147 mg) were suspended in N,N-dimethylformamide (2 ml), and the suspension was stirred at 150°C for 2 hr. The reaction solution was cooled to room temperature, the reaction solution was then filtered, and the solvent was removed from the filtrate by distillation under the reduced pressure. The residue was purified by thin layer chromatography using chloroform-methanol to give 7-bromo-6-hydroxyisoquinoline (11 mg, yield 22%).

[0732] 7-Bromo-6-hydroxyisoquinoline (11 mg), 4-chloro-6,7-dimethoxyquinoline (31 mg), and 4-dimethylaminopyridine (17 mg) were suspended in o-dichlorobenzene (2 ml), and the mixture was stirred at 140°C for 7 hr. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (9 mg, yield 48%).

Mass spectrometric value (ESI-MS, m/z): 432 (M+Na)⁺Compound 305: 6-(6,7-Dimethoxy-quinolin-4-yloxy)-7-methyl-quinazoline

[0741] 3-Hydroxy-4-methylbenzoic acid (3 g) was dissolved in N,N-dimethylformamide (60 ml) to prepare a solution.

Potassium carbonate (6.81 g) and methyl iodide (6.14 ml) were added to the solution, and the mixture was stirred at room temperature overnight. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-hexane to give methyl 3-methoxy-4-methylbenzoate (3.48 g, yield 98%).

[0742] Methyl 3-methoxy-4-methylbenzoate (1 g) was dissolved in acetic acid (1 ml) to prepare a solution which was then cooled to 0°C. Fuming nitric acid (1 ml) was added to the solution in small portions. The mixture was stirred at room temperature overnight. The reaction solution was added in small portions to water of 0°C, and the mixture was neutralized with a 10% aqueous sodium hydroxide solution, followed by extraction with chloroform. The chloroform layer was then washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was used in the next reaction without purification.

[0743] The residue (1.02 g) was dissolved in N,N-dimethylformamide (15 ml) to prepare a solution. Triethylamine (3 ml) and 20% palladium hydroxide (150 mg) were added to the solution, and the mixture was stirred under hydrogen pressure at room temperature overnight. The reaction solution was filtered through Celite and was then washed with chloroform and methanol. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-hexane to give methyl 2-amino-5-methoxy-4-methylbenzoate (522 mg, yield 48%).

[0744] Methyl 2-amino-5-methoxy-4-methylbenzoate (510 mg) was suspended in formamide (5 ml), and the suspension was stirred at 140°C overnight. The precipitated crystal was washed with ether to give 6-methoxy-7-methyl-1H-quinazolin-4-one (275 mg, yield 55%).

[0745] 6-Methoxy-7-methyl-1H-quinazolin-4-one (275 mg) was suspended in N,N-diisopropylethylamine (3.78 ml), phosphorus oxychloride (0.3 ml) was added to the suspension, and the mixture was stirred at 100°C for 6 hr. The reaction solution was added in small portions to water of 0°C, an aqueous sodium hydrogencarbonate solution was further added thereto, and the mixture was extracted with chloroform. The chloroform layer was then washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give 4-chloro-6-methoxy-7-methyl-quinazoline (199 mg, yield 66%).

[0746] 4-Chloro-6-methoxy-7-methyl-quinazoline (99 mg) was dissolved in N,N-dimethylformamide (6 ml) to prepare a solution. Triethylamine (0.6 ml) and 20% palladium hydroxide (4 mg) were added to the solution, and the mixture was stirred under hydrogen pressure at room temperature overnight. The reaction solution was filtered through Celite and was then washed with chloroform and methanol, and the solvent was removed by distillation under the reduced pressure. Water was added to the residue, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give 6-methoxy-7-methyl-quinazoline (76 mg, yield 93%).

[0747] 6-Methoxy-7-methyl-quinazoline (94 mg) was dissolved in N,N-dimethylformamide (5 ml) to prepare a solution, sodium thiomethoxide (376 mg) was added to the solution, and the mixture was stirred at 140°C for one hr. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give 6-hydroxy-7-methyl-quinazoline (64 mg, yield 73%).

[0748] 6-Hydroxy-7-methyl-quinazoline (38 mg), 4-chloro-6,7-dimethoxyquinoline (159 mg), and 4-dimethylaminopyridine (87 mg) were suspended in o-dichlorobenzene (2 ml), and the suspension was stirred at 150°C overnight. The reaction solution was cooled to room temperature, water was then added to the solution, and the mixture was extracted with chloroform. The chloroform layer was washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (71 mg, yield 86%).

Compound 310: 3-(6,7-Dimethoxy-quinolin-4-yloxy)-2-methyl-[1,8]naphthyridine

[0753] 2-Aminopyridine (14.1 g) and triethylamine (19.0 g) were dissolved in dichloromethane (200 ml) to prepare a solution which was then cooled at 0°C. A solution of pivaloylic acid chloride (19.9 g) in dichloromethane (30 ml) was gradually added dropwise to the solution, and the mixture was stirred at 0°C for 15 min. Thereafter, the mixture was stirred at room temperature for 4 hr, and the reaction solution was poured into water (150 ml). The dichloromethane layer was washed with a dilute aqueous sodium hydrogencarbonate solution and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure. The residue was purified by column chromatography using chloroform to give 2,2-dimethyl-N-pyridin-2-yl-propionamide (25.2 g, yield 95%).

[0754] 2,2-Dimethyl-N-pyridin-2-yl-propionamide (20.3 g) was dissolved in tetrahydrofuran (230 ml) to prepare a solution which was then cooled to -78°C. A 2.44 M n-butyllithium/n-hexane solution (100 ml) was gradually added dropwise thereto, and the mixture was stirred at -78°C for 15 min. The reaction solution was stirred at 0°C for 2 hr and was then again cooled to -78°C. A solution of N,N-dimethylformamide (25.0 g) in tetrahydrofuran (25 ml) was gradually added dropwise thereto. The temperature of the mixture was raised to room temperature. The reaction solution was then poured into a mixture of ice (50 g) and 6 N hydrochloric acid (150 ml), and the mixture was stirred at room temperature for 20 min. The aqueous layer was neutralized with potassium carbonate powder and was extracted with diethyl ether. The diethyl ether layer was then washed with water and saturated brine and was dried over magnesium

sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-chloroform to give N-(3-formyl-pyridin-2-yl)-2,2-dimethyl-propionamide (11.8 g, yield 50%).

[0755] N-(3-Formyl-pyridin-2-yl)-2,2-dimethyl-propionamide (9.68 g) was dissolved in 3 N hydrochloric acid (140 ml) to prepare a solution which was then stirred under reflux overnight. The reaction solution was cooled to room temperature, the reaction solution was washed with diethyl ether, and was neutralized with potassium carbonate powder. Diethyl ether was added thereto for extraction. The diethyl ether layer was dried over potassium carbonate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-chloroform to give 2-amino-pyridine-3-carbaldehyde (5.03 g, yield 88%).

[0756] 2-Amino-pyridine-3-carbaldehyde (2.0 g) and chloroacetone (1.5 g) were suspended in a 5 N aqueous sodium hydroxide solution (10 ml) and was allowed to stand in a hermetically sealed state for 3 days. The reaction solution was neutralized with 10% hydrochloric acid, and the precipitated crystal was then collected by filtration. Isopropanol was added to the crystal, and the mixture was heated under reflux. The reaction solution was cooled to room temperature, and the solvent was then removed by distillation. Hexane was added to the residue, and the precipitated crystal was collected by filtration and was washed with hexane to give 2-methyl-[1,8]naphthyridin-3-ol (1.05 g, yield 40%).

[0757] 2-Methyl-[1,8]naphthyridin-3-ol (20 mg), 4-chloro-6,7-dimethoxyquinoline (84 mg), and 4-dimethylaminopyridine (46 mg) were suspended in o-dichlorobenzene (2 ml), and the suspension was stirred at 140°C for 3 hr. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (41 mg, yield 100%).

Compound 311: 3-(6,7-Dimethoxy-quinolin-4-yloxy)-2-methyl-[1,6]naphthyridine

[0758] 4-Aminopyridine (4.70 g) and triethylamine (6.31 g) were dissolved in dichloromethane (75 ml) to prepare a solution which was cooled to 0°C. A solution of pivaloylic acid chloride (6.63 g) in dichloromethane (10 ml) was gradually added dropwise thereto, and the mixture was stirred at 0°C for 15 min. Thereafter, the mixture was stirred at room temperature overnight, and the reaction solution was poured into water (50 ml). The dichloromethane layer was washed with a dilute aqueous sodium hydrogencarbonate solution and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using chloroform to give 2,2-dimethyl-N-pyridin-4-yl-propionamide (7.70 g, yield 87%).

[0759] 2,2-Dimethyl-N-pyridin-4-yl-propionamide (5.60 g) was dissolved in tetrahydrofuran (70 ml) to prepare a solution which was then cooled to -78°C. A 1.57 M n-butyllithium/n-hexane solution (62 ml) was gradually added dropwise thereto, and the mixture was stirred at -78°C for 15 min. The reaction solution was stirred at 0°C for 4 hr and was then again cooled to -78°C. A solution of N,N-dimethylformamide (6.69 g) in tetrahydrofuran (7 ml) was gradually added dropwise thereto. The temperature of the reaction solution was raised to room temperature, the reaction solution was then poured into a mixture composed of ice (10 g) and 6 N hydrochloric acid (30 ml), and the mixture was stirred at room temperature for 15 min. The aqueous layer was neutralized with potassium carbonate powder and was extracted with diethyl ether. The diethyl ether layer was then washed with water and saturated brine and was dried over magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-chloroform to give N-(3-formyl-pyridin-4-yl)-2,2-dimethyl-propionamide (3.35 g, yield 52%).

[0760] N-(3-Formyl-pyridin-4-yl)-2,2-dimethyl-propionamide (3.35 g) was dissolved in 3 N hydrochloric acid (50 ml) to prepare a solution which was stirred under reflux for 5.5 hr. The reaction solution was cooled to room temperature, the reaction solution was then washed with diethyl ether and was neutralized with potassium carbonate powder. Diethyl ether was added thereto, and the mixture was extracted. The diethyl ether layer was dried over potassium carbonate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-chloroform to give 4-amino-pyridine-3-carbaldehyde (1.12 g, yield 58%).

[0761] 4-Amino-pyridine-3-carbaldehyde (1.0 g) and chloroacetone (0.7 g) were suspended in a 5 N aqueous sodium hydroxide solution (5 ml), and the suspension was allowed to stand in a sealed tube for 3 days. The reaction solution was neutralized with 10% hydrochloric acid, and the precipitated crystal was then collected by filtration. Isopropanol was added to the collected crystal, and the mixture was heated under reflux. The reaction solution was cooled to room temperature, and the solvent was then removed by distillation. Hexane was added to the residue, and the precipitated crystal was collected by filtration and was washed with hexane to give 2-methyl-[1,6]naphthyridin-3-ol (0.60 g, yield 46%).

[0762] 2-Methyl-[1,6]naphthyridin-3-ol (20 mg), 4-chloro-6,7-dimethoxyquinoline (84 mg), and 4-dimethylaminopyridine (46 mg) were suspended in o-dichlorobenzene (2 ml), and the suspension was stirred at 140°C for 3 hr. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (23 mg, yield 55%).

Compound 312: 1-[2-(7-Hydroxy-6-methoxy-quinolin-4-yloxy)-5-methoxy-phenyl]-ethanone

[0763] 2-Hydroxy-5-methoxyacetophenone (3.00 g), 7-benzyloxy-4-chloro-6-methoxyquinoline (6.65 g), and 4-dimethylaminopyridine (4.90 g) were suspended in o-dichlorobenzene (30 ml), and the suspension was stirred at 180°C for 2 hr. The reaction solution was cooled to room temperature, and the solvent was then removed by distillation under the reduced pressure. Water was added to the residue, and the mixture was extracted with chloroform. The chloroform layer was then washed with water and saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-chloroform to give 1-[2-(7-benzyloxy-6-methoxy-quinolin-4-yloxy)-5-methoxy-phenyl]-ethanone (2.53 g, yield 59%).

[0764] 1-[2-(7-Benzyloxy-6-methoxy-quinolin-4-yloxy)-5-methoxy-phenyl]-ethanone (2.52 g) was suspended in a mixed solution composed of methanesulfonic acid (3 ml) and trifluoroacetic acid (50 ml), and the suspension was stirred at 70°C for 30 min. The solvent was removed by distillation under the reduced pressure, water was added to the residue, and the mixture was neutralized with sodium hydrogencarbonate powder and was then extracted with chloroform. The chloroform layer was then washed with water and saturated brine and was dried over anhydrous magnesium sulfate, the solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using chloroform-methanol to give the title compound (1.23 g, yield 62%).

Compound 322: Propyl 3-[7-(2-chloro-ethoxy)-6-methoxy-quinolin-4-yloxy]-naphthalene-2-carboxylate

[0774] 3-Hydroxy-naphthalene-2-carboxylic acid (2 g) was dissolved in 1-propanol (10 ml) to prepare a solution which was then brought to 0°C. Thionyl chloride (1.16 ml) was gradually added dropwise to the solution, and the mixture was stirred at 120°C for 2 hr. The reaction solution was cooled to room temperature, and the solvent was removed by distillation under the reduced pressure. Water was then added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using chloroform to give propyl 3-hydroxy-naphthalene-2-carboxylate (2.15 g, yield 88%).

[0775] Propyl 3-hydroxy-naphthalene-2-carboxylate (460 mg), 7-benzyloxy-4-chloro-6-methoxyquinoline (200 mg), and 4-dimethylaminopyridine (244 mg) were suspended in o-dichlorobenzene (4 ml), and the mixture was stirred at 120°C for 5 hr. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with chloroform. The chloroform layer was washed with saturated brine and was dried over anhydrous sodium sulfate, the solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-acetone to give propyl 3-(7-benzyloxy-6-methoxy-quinolin-4-yloxy)-naphthalene-2-carboxylate (165 mg, yield 50%).

[0776] Propyl 3-(7-benzyloxy-6-methoxy-quinolin-4-yloxy)-naphthalene-2-carboxylate (160 mg) was dissolved in tri-fluoroacetic acid (1.5 ml) to prepare a solution. Methanesulfonic acid (0.15 ml) was added to the solution, and the mixture was stirred at 70°C for one hr. The reaction solution was cooled to room temperature, and the solvent was removed by distillation under the reduced pressure. An aqueous sodium hydrogencarbonate solution was then added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-acetone to give propyl 3-(7-hydroxy-

6-methoxy-quinolin-4-yloxy)-naphthalene-2-carboxylate (87 mg, yield 68%).

[0777] Propyl 3-(7-hydroxy-6-methoxy-quinolin-4-yloxy)-naphthalene-2-carboxylate (80 mg) and 1-bromo-2-chloroethane (0.082 ml) were dissolved in N,N-dimethylformamide (2 ml) to prepare a solution. Potassium carbonate (274 mg) was added to the solution, and the mixture was stirred at room temperature overnight. Water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-chloroform to give the title compound (85 mg, yield 91%).

Compound 325: Propyl 3-[7-(3-chloro-propoxy)-6-methoxy-quinolin-4-yloxy]-naphthalene-2-carboxylate

[0780] Propyl 3-(7-hydroxy-6-methoxy-quinolin-4-yloxy)-naphthalene-2-carboxylate (240 mg) was dissolved in N,N-dimethylformamide (6 ml) to prepare a solution. Potassium carbonate (822 mg) and 1-bromo-3-chloropropane (0.29 ml) were added to the solution, and the mixture was stirred at room temperature overnight. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using acetone-chloroform to give the title compound (230 mg, yield 81%).

¹H-NMR (CDCl₃, 400 MHz): δ 0.71 (t, J = 7.3 Hz, 3H), 1.30 - 1.39 (m, 2H), 2.39 - 2.45 (m, 2H), 3.83 (t, J = 6.3 Hz, 2H), 4.02 - 4.04 (m, 2H), 4.05 (s, 3H), 4.39 (t, J = 6.1 Hz, 2H), 6.35 (d, J = 5.6 Hz, 1H), 7.56 - 7.68 (m, 5H), 7.84 (d, J = 8.1 Hz, 1H), 8.02 (d, J = 8.1 Hz, 1H), 8.43 (d, J = 5.4 Hz, 1H), 8.67 (s, 1H)

Compound 326: Propyl 3-[6-methoxy-7-(3-morpholin-4-yl-propoxy)-quinolin-4-yloxy]-naphthalene-2-carboxylate

[0781] Propyl 3-[7-(3-chloro-propoxy)-6-methoxy-quinolin-4-yloxy]-naphthalene-2-carboxylate (compound 325)

(110 mg) was dissolved in N,N-dimethylformamide (3 ml) to prepare a solution. Potassium carbonate (317 mg) and morpholine (0.1 ml) were added to the solution, and the mixture was stirred at 60°C overnight. Water was added to the reaction solution, the mixture was extracted with chloroform, and the chloroform layer was then washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (106 mg, yield 87%).

¹H-NMR (CDCl₃, 400 MHz): δ 0.70 (t, J = 7.6 Hz, 3H), 1.29 - 1.38 (m, 2H), 2.17 - 2.20 (m, 2H), 2.56 - 2.65 (m, 6H), 3.76 - 3.78 (m, 4H), 4.02 - 4.03 (m, 2H), 4.05 (s, 3H), 4.30 (t, J = 6.6 Hz, 2H), 6.33 (d, J = 5.4 Hz, 1H), 7.50 (s, 1H), 7.57 - 7.67 (m, 4H), 7.83 (d, J = 7.8 Hz, 1H), 8.02 (d, J = 8.1 Hz, 1H), 8.43 (d, J = 5.4 Hz, 1H), 8.66 (s, 1H)

Mass spectrometric value (ESI-MS, m/z): 531 (M+1)⁺

Compound 327: Propyl 3-[7-(3-imidazol-1-yl-propoxy)-6-methoxy-quinolin-4-yloxy]-naphthalene-2-carboxylate

[0782] Propyl 3-[7-(3-chloro-propoxy)-6-methoxy-quinolin-4-yloxy]-naphthalene-2-carboxylate (compound 325) (110 mg) was dissolved in N,N-dimethylformamide (3 ml) to prepare a solution. Potassium carbonate (317 mg) and imidazole (78 mg) were added to the solution, and the mixture was stirred at 60°C overnight. Water was added to the reaction solution, and the mixture was extracted with chloroform. The chloroform layer was then washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (97 mg, yield 82%).

¹H-NMR (CDCl₃, 400 MHz): δ 0.73 (t, J = 7.6 Hz, 3H), 1.32 - 1.41 (m, 2H), 2.38 - 2.44 (m, 2H), 4.05 (t, J = 6.6 Hz, 2H), 4.08 (s, 3H), 4.19 (t, J = 5.9 Hz, 2H), 4.29 (t, J = 6.8 Hz, 2H), 6.36 (d, J = 5.6 Hz, 1H), 6.98 (s, 1H), 7.08 (s, 1H), 7.50 (s, 1H), 7.57 - 7.70 (m, 5H), 7.84 (d, J = 8.1 Hz, 1H), 8.02 (d, J = 8.3 Hz, 1H), 8.43 (d, J = 5.6 Hz, 1H), 8.67 (s, 1H)

Mass spectrometric value (ESI-MS, m/z): 512 (M+1)⁺

Compound 328: 7-Benzyloxy-6-methoxy-4-(6-methyl-2-thiazol-2-yl-pyridin-3-yloxy)-quinoline

[0783] 2-Iodo-6-picolin-3-ol (10 g), 4-chloro-7-benzyloxy-6-methoxyquinoline (6.8 g), and 4-(N,N-dimethylamino)-pyridine (12.2 g) were dissolved in 1,2-dichlorobenzene (400 ml) to prepare a solution, and the mixture was stirred at 125°C overnight. The reaction solution was cooled to room temperature, and the solvent was then removed by distillation under the reduced pressure. Water was added to the residue, the mixture was extracted with chloroform, and the chloroform layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure. The residue was purified by column chromatography using chloroform-acetone to give 7-benzyloxy-4-(2-iodo-6-methyl-pyridin-3-yloxy)-6-methoxy-quinoline (5.2 g, yield 31%).

[0784] N,N-Dimethylformamide (2 ml) was added to 7-benzyloxy-4-(2-iodo-6-methyl-pyridin-3-yloxy)-6-methoxy-quinoline (100 mg), tetrakis(triphenylphosphine) palladium (23 mg), tri-n-butyl-(thiazol-2-yl)-tin (113 mg), and copper(II) oxide (32 mg) under an argon atmosphere, and the mixture was stirred at 100°C overnight. The reaction solution was cooled to room temperature, water was then added thereto, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using hexane-acetone to give the title compound (43 mg, yield 46%).

¹H-NMR (CDCl₃, 400 MHz): δ 2.63 (s, 3H), 3.96 (s, 3H), 5.25 (s, 2H), 6.29 (d, J = 5.4 Hz, 1H), 7.17 - 7.48 (m, 9H), 7.62 (s, 1H), 7.74 (d, J = 3.2 Hz, 1H), 8.34 (d, J = 5.4 Hz, 1H)

Mass spectrometric value (ESI-MS, m/z): 478 (M+Na)⁺

Compound 329: 6-Methoxy-4-(6-methyl-2-thiazol-2-yl-pyridin-3-yloxy)-quinolin-7-ol

[0785] Trifluoroacetic acid (1 ml) and methanesulfonic acid (0.1 ml) were added to 7-benzyloxy-6-methoxy-4-(6-methyl-2-thiazol-2-yl-pyridin-3-yloxy)-quinoline (compound 328) (40 mg), and the mixture was stirred at 80°C for 1.5 hr. The reaction solution was cooled to room temperature, and a saturated aqueous sodium hydrogencarbonate solution was then added to the reaction solution. The mixture was made alkaline, and the mixture was then extracted with chloroform. The chloroform layer was washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (23 mg, yield 70%).

¹H-NMR (CDCl₃, 400 MHz): δ 2.70 (s, 3H), 4.06 (s, 3H), 6.35 (d, J = 5.4 Hz, 1H), 7.28 (d, J = 8.3 Hz, 1H), 7.34 (d, J = 3.2 Hz, 1H), 7.48 (d, J = 8.3 Hz, 1H), 7.57 (s, 1H), 7.69 (s, 1H), 7.79 (d, J = 3.2 Hz, 1H), 8.43 (d, J = 5.4 Hz, 1H)

Mass spectrometric value (ESI-MS, m/z): 388 (M+Na)⁺

Compound 330: 2-[6-Methoxy-4-(6-methyl-2-thiazol-2-yl-pyridin-3-yloxy)-quinolin-7-yloxymethyl]-propane-1,3-diol

[0786] A solution of 2-methoxypropene (1 g) in N,N-dimethylformamide (150 ml) was added to 2-(hydroxymethyl)-1,3-propanediol (500 mg). p-Toluenesulfonic acid (10 mg) was added thereto, and the mixture was stirred at room temperature overnight. The solvent was removed by distillation under the reduced pressure, water was added to the residue, and the mixture was extracted with n-butanol. The n-butanol layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using hexane-acetone to give (2,2-dimethyl[1,3]dioxan-5-yl)-methanol (378 mg, yield 55%).

[0787] Toluene (0.4 ml) was added to 6-methoxy-4-(6-methyl-2-thiazol-2-yl-pyridin-3-yloxy)-quinolin-7-ol (compound 329) (20 mg) and (2,2-dimethyl[1,3]dioxan-5-yl)-methanol (24 mg). Triphenylphosphine (43 mg) and a solution of diethylazocarbodiimide (29 mg) in toluene (0.2 ml) were added in that order to the mixture, and the mixture was stirred at room temperature for 4 hr. A 1 N aqueous sulfuric acid solution (1 ml) was added to the reaction solution, and the mixture was stirred at room temperature overnight. Water was added to the reaction solution, the mixture was washed with ethyl acetate, and the ethyl acetate layer was extracted with 1 N hydrochloric acid. Aqueous layers were combined, the combined aqueous layers were made alkaline by the addition of potassium carbonate, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (4.7 mg, yield 19%).

¹H-NMR (CDCl₃, 400 MHz): δ 2.34 - 2.47 (m, 1H), 2.63 (s, 3H), 3.96 - 4.05 (m, 7H), 4.41 (d, J = 5.6 Hz, 2H), 6.38 (d, J = 5.1 Hz, 1H), 7.30 (d, J = 8.3 Hz, 1H), 7.36 (d, J = 3.2 Hz, 1H), 7.47 (s, 1H), 7.50 (d, J = 8.6 Hz, 1H), 7.67 (s, 1H), 7.81 (d, J = 3.2 Hz, 1H), 8.43 (d, J = 5.1 Hz, 1H)

Mass spectrometric value (ESI-MS, m/z): 454 (M+1)⁺

Compound 331: 7-Benzyloxy-4-(5,6-dimethyl-2-phenyl-pyridin-3-yloxy)-6-methoxy-quinoline

[0788] 5,6-Dimethyl-2-phenyl-pyridin-3-ol (400 mg), 7-benzyloxy-4-chloro-6-methoxyquinoline (1.81 g), and 4-dimethylaminopyridine (736 mg) were suspended in o-dichlorobenzene (10 ml), and the suspension was stirred at 140°C for 4 hr. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with chloroform. The chloroform layer was washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using chloroform-methanol to give the title compound (965 mg, yield 100%).

¹H-NMR (CDCl₃, 400 MHz): δ 2.35 (s, 3H), 2.62 (s, 3H), 4.02 (s, 3H), 5.31 (s, 2H), 6.37 (d, J = 5.4 Hz, 1H), 7.25 - 7.52 (m, 11H), 7.82 - 7.85 (m, 2H), 8.40 (d, J = 5.4 Hz, 1H)

Mass spectrometric value (ESI-MS, m/z): 463 (M+1)⁺

Compound 332: 4-(5,6-Dimethyl-2-phenyl-pyridin-3-yloxy)-6-methoxy-quinolin-7-ol

[0789] 7-Benzyloxy-4-(5,6-dimethyl-2-phenyl-pyridin-3-yloxy)-6-methoxy-quinoline (compound 331) (958 mg) was dissolved in trifluoroacetic acid (9.5 ml) to prepare a solution. Methanesulfonic acid (0.95 ml) was added to the solution, and the mixture was stirred at 70°C for one hr. The reaction solution was cooled to room temperature, and the solvent was removed by distillation under the reduced pressure. An aqueous sodium hydrogencarbonate solution was then added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using chloroform-methanol to give the title compound (848 mg, yield 100%).

¹H-NMR (CDCl₃, 400 MHz): δ 2.35 (s, 3H), 2.62 (s, 3H), 4.04 (s, 3H), 6.37 (d, J = 5.1 Hz, 1H), 7.25 - 7.31 (m, 4H), 7.52 (d, J = 4.4 Hz, 2H), 7.82 - 7.85 (m, 2H), 8.44 (d, J = 5.1 Hz, 1H)

Mass spectrometric value (ESI-MS, m/z): 373 (M+1)⁺

Compound 333: 2-[4-(5,6-Dimethyl-2-phenyl-pyridin-3-yloxy)-6-methoxy-quinolin-7-yloxy]-ethanol

[0790] 4-(5,6-Dimethyl-2-phenyl-pyridin-3-yloxy)-6-methoxy-quinolin-7-ol (compound 332) (162 mg) was dissolved in N,N-dimethylformamide (3 ml) to prepare a solution. Potassium carbonate (180 mg) and 2-bromoethanol (0.1 ml) were added to the solution, and the mixture was stirred at 70°C overnight. The solvent was removed by distillation under the reduced pressure, water was then added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using

chloroform-acetone to give the title compound (135 mg, yield 76%).

¹H-NMR (CDCl₃, 400 MHz): δ 2.36 (s, 3H), 2.63 (s, 3H), 4.00 (s, 3H), 4.09 (t, J = 4.4 Hz, 2H), 4.29 (t, J = 4.9 Hz, 2H), 6.39 (d, J = 5.4 Hz, 1H), 7.24 - 7.29 (m, 4H), 7.44 (s, 1H), 7.51 (s, 1H), 7.82 - 7.85 (m, 2H), 8.42 (d, J = 5.4 Hz, 1H)

Compound 335: 3-[4-(5,6-Dimethyl-2-phenyl-pyridin-3-yloxy)-6-methoxy-quinolin-7-yloxy]-propane-1,2-diol

[0792] 4-(5,6-Dimethyl-2-phenyl-pyridin-3-yloxy)-6-methoxy-7-oxiranylmethoxy-quinoline (compound 334) (130 mg) was dissolved in methylene chloride (2 ml) to prepare a solution which was then brought to 0°C. Trifluoroacetic acid (1 ml) was added to the solution, and the mixture was stirred at 0°C for 30 min and was then stirred at room temperature for 3 hr. The reaction solution was brought to 0°C, was stirred, and was made alkaline by the addition of a 10% aqueous sodium hydroxide solution. Water was added to the reaction solution, and the mixture was extracted with chloroform. The chloroform layer was then washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (89 mg, yield 66%).

¹H-NMR (CD₃OD, 400 MHz): δ 2.41 (s, 3H), 2.60 (s, 3H), 3.69 - 3.78 (m, 2H), 3.99 (s, 3H), 4.08 - 4.16 (m, 2H), 4.21 - 4.25 (m, 1H), 6.38 (d, J = 5.4 Hz, 1H), 7.24 - 7.31 (m, 4H), 7.56 (d, J = 3.4 Hz, 2H), 7.69 - 7.72 (m, 2H), 8.30 (d, J = 5.4 Hz, 1H)

Compound 336: 2-[4-(5,6-Dimethyl-2-phenyl-pyridin-3-yloxy)-6-methoxy-quinolin-7-yloxymethyl]-propane-1,3-diol

[0793] 4-(5,6-Dimethyl-2-phenyl-pyridin-3-yloxy)-6-methoxy-quinolin-7-ol (compound 332) (85 mg) was dissolved in tetrahydrofuran (2 ml) to prepare a solution. Triphenylphosphine (120 mg), (2,2-dimethyl-[1,3]dioxan-5-yl)-methanol (40 mg), and diethylazodicarboxylic acid (0.083 ml) were added to the solution, and the mixture was stirred at room temperature for 4 hr. Further, 1 N sulfuric acid (4 ml) was added thereto, and the mixture was stirred at room temperature overnight. The reaction solution was brought to 0°C, was stirred, and was made alkaline by the addition of a 10% aqueous sodium hydroxide solution. Water was added thereto, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (80 mg, yield 76%).

20 Compound 339: 2-[4-(5,6-Dimethyl-[2,2']bipyridin-3-yloxy)-6-methoxy-quinolin-7-yloxy]-ethanol

[0796] 4-(5,6-Dimethyl-[2,2']bipyridin-3-yloxy)-6-methoxy-quinolin-7-ol (compound 338) (80 mg) was dissolved in N,N-dimethylformamide (2 ml) to prepare a solution. Potassium carbonate (89 mg) and 2-bromoethanol (0.05 ml) were added to the solution, and the mixture was stirred at 70°C overnight. The solvent was removed by distillation under the reduced pressure, water was then added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with saturated brine and was dried over anhydrous sodium sulfate, the solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (77 mg, yield 88%).

25 ¹H-NMR (CDCl₃, 400 MHz): δ 2.39 (s, 3H), 2.66 (s, 3H), 4.00 (s, 3H), 4.08 (t, J = 4.4 Hz, 2H), 4.29 (t, J = 4.6 Hz, 2H), 6.38 (dd, J = 0.5 Hz, 5.4 Hz, 1H), 7.10 - 7.13 (m, 1H), 7.37 (s, 1H), 7.43 (s, 1H), 7.56 (s, 1H), 7.57 - 7.61 (m, 1H), 7.81 (dd, J = 1.0 Hz, 8.1 Hz, 1H), 8.39 (d, J = 5.4 Hz, 1H), 8.48 - 8.49 (m, 1H)
Mass spectrometric value (ESI-MS, m/z): 418 (M+1)⁺

30 Compound 340: 3-[4-(5,6-Dimethyl-[2,2']bipyridin-3-yloxy)-6-methoxy-quinolin-7-yloxy]-propan-1-ol

35 [0797] 4-(5,6-Dimethyl-[2,2']bipyridin-3-yloxy)-6-methoxy-quinolin-7-ol (compound 338) (45 mg) was suspended in N,N-dimethylformamide (5 ml), potassium carbonate (50 mg) and 3-bromo-1-propanol (0.03 ml) were added to the suspension, and the mixture was stirred at room temperature overnight. The solvent was removed by distillation under the reduced pressure, water was then added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-acetone to give the title compound (22 mg, yield 42%).

Compound 342: 3-[4-(5,6-Dimethyl-[2,2']bipyridin-3-yloxy)-6-methoxy-quinolin-7-yloxy]-propane-1,2-diol

[0799] 3-(6-Methoxy-7-oxiranylmethoxy-quinolin-4-yloxy)-5,6-dimethyl-[2,2']bipyridine (compound 341) (95 mg) was dissolved in methylene chloride (2 ml) to prepare a solution which was then brought to 0°C. Trifluoroacetic acid (1 ml) was added to the solution, the mixture was stirred at 0°C for 30 min, and the mixture was then stirred at room temperature for 5 hr. The reaction solution was brought to 0°C, was stirred, and was made alkaline by the addition of a 10% aqueous sodium hydroxide solution. Water was added thereto, the mixture was extracted with chloroform, and the chloroform layer was then washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (63 mg, yield 64%).

Compound 343: 2-[4-(5,6-Dimethyl-[2,2']bipyridin-3-yloxy)-6-methoxy-quinolin-7-yloxymethyl]-propane-1,3-diol

[0800] 4-(5,6-Dimethyl-[2,2']bipyridin-3-yloxy)-6-methoxy-quinolin-7-ol (compound 338) (80 mg) was dissolved in tetrahydrofuran (2 ml) to prepare a solution. Triphenylphosphine (112 mg), (2,2-dimethyl-[1,3]dioxan-5-yl)-methanol (38 mg), and diethylazodicarboxylate (0.078 ml) were added to the solution, and the mixture was stirred at room temperature for 6 hr. Further, 1 N sulfuric acid (4 ml) was added thereto, the mixture was stirred at room temperature overnight, and the reaction solution was brought to 0°C and was stirred. The reaction solution was made alkaline by the addition of a 10% aqueous sodium hydroxide solution. Water was added thereto, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (50 mg, yield 52%).

Compound 356: N-{2-[6-Methoxy-4-(2-methyl-quinolin-3-yloxy)-quinolin-7-yloxy]-ethyl}-guanidine

[0813] A solution of 2-[6-methoxy-4-(2-methyl-quinolin-3-yloxy)-quinolin-7-yloxy]-ethylamine (compound 354) (340 mg) in dichloromethane (1 ml) and N,N-dimethylformamide (0.5 ml) were added to 1,3-diboc-2-(trifluoromethylsulfonyl)guanidine (355 mg), and the mixture was stirred at room temperature for 4 hr. The solvent was removed from the reaction solution under the reduced pressure, water was added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with water and was then dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give N-{2-[6-methoxy-4-(2-methyl-quinolin-3-yloxy)-quinolin-7-yloxy]-ethyl}-N',N'-diboc-guanidine (223 mg, yield 33%).

[0814] Trifluoroacetic acid (1 ml) was added to N-{2-[6-methoxy-4-(2-methyl-quinolin-3-yloxy)-quinolin-7-yloxy]-ethyl}-N',N'-diboc-guanidine (222 mg) at 0°C, and the mixture was then stirred at 0°C for 2 hr. The reaction solution was made alkaline by the addition of a 1 N aqueous sodium hydroxide solution and was extracted with n-butanol. The n-butanol layer was washed with water and was then dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (150 mg, yield 100%).

Compound 357: 4-{2[6-Methoxy-4-(2-methyl-quinolin-3-yloxy)-quinolin-7-yloxy]-ethylcarbamoyl}-3,3-dimethyl-butanolic acid

[0815] N,N-Dimethylformamide (1 ml) was added to 7-(2-chloro-ethoxy)-6-methoxy-4-(2-methyl-quinolin-3-yloxy)-quinoline (compound 353) (50 mg), potassium carbonate (53 mg), and 4,4-dimethylpiperidine-2,6-dione (54 mg), and the mixture was stirred at 80°C overnight and then at 100°C for one day. The reaction solution was cooled to room temperature, water was added to the reaction solution, and the mixture was extracted with chloroform. The chloroform layer was washed with water and was then dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (3.5 mg, yield 5%).

5 Compound 358: 6-Methoxy-4-(2-methyl-quinolin-3-yloxy)-7-(2-piperidin-1-yl-ethoxy)-quinoline

[0816] N,N-Dimethylformamide (1 ml) was added to 7-(2-chloro-ethoxy)-6-methoxy-4-(2-methyl-quinolin-3-yloxy)-quinoline (compound 353) (35 mg), potassium carbonate (37 mg), and piperidine (23 mg), and the mixture was stirred at 75°C overnight. The reaction solution was cooled to room temperature, water was added to the reaction solution, and the mixture was extracted with chloroform. The chloroform layer was washed with water and was then dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (35 mg, yield 89%).

Compound 374: 2-[6-Methoxy-4-(2-methyl-quinolin-3-yloxy)-quinolin-7-yloxy]-propane-1,3-diol

[0832] Diethyl 2-[6-methoxy-4-(2-methyl-quinolin-3-yloxy)-quinolin-7-yloxy]-malonate (compound 373) (50 mg) was dissolved in tetrahydrofuran (1 ml) to prepare a solution. Lithium aluminum hydride (10 mg) was added to the solution at 0°C, and the mixture was stirred at 0°C for 3 hr and then at room temperature for 2 hr. Water was added to the reaction solution to stop the reaction. The mixture was filtered through Celite, water was then added to the filtrate, and the mixture was extracted with chloroform. The chloroform layer was washed with water and was then dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (9.1 mg, yield 22%).

Compound 387: 2-[6-Methoxy-4-(2-methyl-quinolin-3-yloxy)-quinolin-7-yloxymethyl]-propane-1,3-diol

[0846] 6-Methoxy-4-(2-methyl-quinolin-3-yloxy)-quinolin-7-ol (compound 352) (50 mg) and triphenylphosphine (158 mg) were dissolved in tetrahydrofuran (1 ml) to prepare a solution. A solution of diethylazocarbodiimide (105 mg) in (2,2-dimethyl[1,3]dioxan-5-yl)-methanol (27 mg) and tetrahydrofuran (0.2 ml) was added to the solution, and the mixture was stirred at room temperature for 5 hr. A 1 N aqueous sulfuric acid solution (1 ml) was then added to the reaction solution, and the mixture was stirred at room temperature overnight. The reaction solution was made alkaline by the addition of 1 N sodium hydroxide, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (29 mg, yield 45%).

Compound 388: 2,2-Bis-hydroxymethyl-3-[6-methoxy-4-(2-methyl-quinolin-3-yloxy)-quinolin-7-yroxy]-propan-1-ol

[0847] N,N-Dimethylformamide (1.5 ml) was added to 6-methoxy-4-(2-methyl-quinolin-3-yloxy)-quinolin-7-ol (compound 352) (50 mg), potassium carbonate (62 mg), and 2-bromomethyl-2-hydroxymethyl-propane-1,3-diol (90 mg), and the mixture was stirred at 80°C overnight. The reaction solution was cooled to room temperature, water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was washed with water and was then dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was dissolved in dichloromethane (3 ml) to prepare a solution. Trifluoroacetic acid (3 ml) was added dropwise to the solution at 0°C, and the mixture was then stirred at room temperature for 3 hr. The reaction solution was made alkaline by the addition of a 1 N aqueous sodium hydroxide solution and was extracted with chloroform. The chloroform layer was washed with water and was then dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (14 mg, yield 21%).

Compound 390: 1-[3-(7-Hydroxy-6-methoxy-quinolin-4-yloxy)-quinolin-2-yl]-ethanone

[0849] 3-Hydroxy-quinoline-2-carbaldehyde (1.7 g) was dissolved in tetrahydrofuran (50 ml) to prepare a solution which was then cooled to -78°C. Methylmagnesium bromide (32 ml) was gradually added dropwise to the solution, and the mixture was stirred at room temperature overnight. Water was added to the reaction solution, and the mixture was neutralized with 10% hydrochloric acid and was extracted with chloroform. The chloroform layer was washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was used in the next reaction without purification.

[0850] The residue (1.73 g) was dissolved in methanol (8 ml) and dichloromethane (24 ml) to prepare a solution.

Manganese dioxide (19.5 g) was added to the solution, and the mixture was stirred at room temperature for 2 days. The reaction solution was filtered through Celite and was then washed with chloroform and methanol. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using hexane-acetone to give (3-hydroxy-quinolin-2-yl)-ethanone (878 mg, yield 54%).

[0851] (3-Hydroxy-quinolin-2-yl)-ethanone (878 mg), 7-benzyloxy-4-chloro-6-methoxyquinoline (7.03 g), and 4-dimethylaminopyridine (3.44g) were suspended in o-dichlorobenzene (20 ml), and the mixture was stirred at 130°C overnight. The reaction solution was cooled to room temperature, water was then added thereto, and the mixture was extracted with chloroform. The chloroform layer was washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using chloroform-acetone to give 1-[3-(7-benzyloxy-6-methoxy-quinolin-4-yloxy)-quinolin-2-yl]-ethanone (758 mg, yield 36%).

[0852] 1-[3-(7-Benzyloxy-6-methoxy-quinolin-4-yloxy)-quinolin-2-yl]-ethanone (758 mg) was dissolved in trifluoroacetic acid (6 ml) to prepare a solution, methanesulfonic acid (0.6 ml) was added to the solution, and the mixture was stirred at 70°C for 1.5 hr. The reaction solution was cooled to room temperature, and the solvent was removed by distillation under the reduced pressure. An aqueous sodium hydrogencarbonate solution was then added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with saturated brine and was dried over anhydrous sodium sulfate, the solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using chloroform-methanol to give the title compound (609 mg, yield 100%).

Compound 391: 1-[3-[6-Methoxy-7-(2-morpholin-4-yl-ethoxy)-quinolin-4-yloxy]-quinolin-2-yl]-ethanone

[0853] 1-[3-(7-Hydroxy-6-methoxy-quinolin-4-yloxy)-quinolin-2-yl]-ethanone (compound 390) (86 mg) was dissolved in N,N-dimethylformamide (2 ml) to prepare a solution. Potassium carbonate (330 mg) and 1-bromo-2-chloroethane (1 ml) were added to the solution, and the mixture was stirred at room temperature overnight. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using acetone-chloroform to give 1-[3-[7-(2-chloro-ethoxy)-6-methoxy-quinolin-4-yloxy]-quinolin-2-yl]-ethanone (75 mg, yield 74%).

[0854] 1-[3-[7-(2-Chloro-ethoxy)-6-methoxy-quinolin-4-yloxy]-quinolin-2-yl]-ethanone (37 mg) was dissolved in N,N-dimethylformamide (1 ml) to prepare a solution. Potassium carbonate (242 mg) and morpholine (0.1 ml) were added to the solution, and the mixture was stirred at 60°C for 2 days. Water was added to the reaction solution and was extracted with ethyl acetate. The ethyl acetate layer was then washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (11 mg, yield 27%).

Compound 414: 6-Methoxy-4-(2-methyl-quinolin-3-yloxy)-7-pyridin-4-yl-quinoline

[0884] 4-Chloro-6-methoxy-quinolin-7-yl trifluoro-methanesulfonate (114 mg), 4-pyridine boronic acid (55 mg), and tetrakis(triphenylphosphine) palladium (30 mg) were dissolved in N,N-dimethylformamide (4 ml) to prepare a solution. A 2 M aqueous potassium carbonate solution (0.3 ml) was added to the reaction system, and the mixture was stirred at 80°C for 2 hr. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue (84 mg) was used in the next reaction without purification. [0885] A part (58 mg) of the residue, 3-hydroxy-2-methyl-quinoline-4-carboxylic acid (124 mg), and 4-dimethylaminopyridine (120 mg) were dissolved in o-dichlorobenzene (5 ml), and the solution was stirred at 130°C overnight and further at 160°C for 4 hr. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using acetone-chloroform to give the title compound (14 mg, yield 16%) (2 steps).

Compound 415: 6-Benzyloxy-7-methoxy-4-(2-methyl-quinolin-3-yloxy)-quinoline

[0886] 3-Hydroxy-2-methyl-4-quinoline carboxylic acid (549 mg), 6-benzyloxy-4-chloro-7-methoxyquinoline (810 mg), and 4-(N,N-dimethylamino)-pyridine (990 mg) were dissolved in 1,2-dichlorobenzene (40 ml) to prepare a solution. The mixture was stirred at 150°C overnight. The reaction solution was cooled to room temperature, and the solvent was then removed by distillation under the reduced pressure. Water was added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with water and was then dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using hexane-acetone to give the title compound (718 mg, yield 63%).

Compound 416: 6-(2-Imidazol-1-yl-ethoxy)-7-methoxy-4-(2-methyl-quinolin-3-yloxy)-quinoline

[0887] Trifluoroacetic acid (5 ml) and methanesulfonic acid (0.2 ml) were added to 6-benzyloxy-7-methoxy-4-(2-methyl-quinolin-3-yloxy)-quinoline (compound 415) (700 mg), and the mixture was stirred at 100°C for 2 hr. The reaction solution was cooled to room temperature, and the solvent was then removed by distillation under the reduced pressure. A saturated aqueous sodium hydrogencarbonate solution was added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with a saturated aqueous sodium hydrogencarbonate solution and water and was then dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using chloroform-methanol to give 7-methoxy-4-(2-methyl-quinolin-3-yloxy)-quinolin-6-ol (26 mg, yield 5%).

[0888] 7-Methoxy-4-(2-methyl-quinolin-3-yloxy)-quinolin-6-ol (25 mg) was dissolved in N,N-dimethylformamide (1 ml) to prepare a solution. 1-Bromo-2-chloroethane (54 mg) and potassium carbonate (52 mg) were added to the solution, and the mixture was stirred at room temperature overnight. Water was added to the reaction solution, and the mixture was extracted with chloroform. The chloroform layer was washed with water and was then dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure. The residue was purified by thin layer chromatography using chloroform-methanol to give 6-(2-chloro-ethoxy)-7-methoxy-4-(2-methyl-quinolin-3-yloxy)-quinoline (24 mg, yield 79%).

[0889] N,N-Dimethylformamide (3 ml) was added to 6-(2-chloro-ethoxy)-7-methoxy-4-(2-methyl-quinolin-3-yloxy)-quinoline (24 mg), potassium carbonate (25 mg), imidazole (12 mg), and sodium iodide (1.8 mg), and the mixture was stirred at 75°C overnight. The reaction solution was cooled to room temperature, and the solvent was removed by distillation under the reduced pressure. Water was added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with water and was then dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure. The residue was purified by thin layer chromatography using

chloroform-methanol to give the title compound (9.2 mg, yield 36%).

Compound 417: 3-[7-Methoxy-4-(2-methyl-quinolin-3-yloxy)-quinolin-6-yloxy]propane-1,2-diol

[0890] N,N-Dimethylformamide (6 ml) was added to 7-methoxy-4-(2-methyl-quinolin-3-yloxy)-quinolin-6-ol (189 mg), potassium carbonate (236 mg), and epibromohydrin (234 mg), and the mixture was stirred at room temperature overnight. Water was added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was washed with water and was then dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using hexane-acetone to give 7-methoxy-4-(2-methyl-quinolin-3-yloxy)-6-oxiranylmethoxy-quinoline (59 mg, yield 27%).

[0891] 7-Methoxy-4-(2-methyl-quinolin-3-yloxy)-6-oxiranylmethoxy-quinoline (59 mg) was dissolved in dichloromethane (2 ml) to prepare a solution. Trifluoroacetic acid (2 ml) was added dropwise to the solution at 0°C, and the mixture was then stirred at room temperature for 4 hr. The reaction solution was made alkaline by the addition of 1 N sodium hydroxide, and the mixture was extracted with chloroform. The chloroform layer was washed with water and was then dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (18 mg, yield 29%).

Compound 419: Ethyl 2-(6,7-dimethoxy-quinolin-4-ylsulfanyl)-5-fluoro-benzoate

[0893] 5-Fluoro-2-mercaptobenzoic acid (278 mg) and 4-chloro-6,7-dimethoxyquinoline (300 mg) were suspended in acetonitrile (6 ml), and the suspension was stirred at room temperature overnight. The solvent was removed by distillation under the reduced pressure. Water was added to the residue, the mixture was neutralized with sodium hydrogencarbonate and was then extracted with chloroform. The chloroform layer was washed with water and saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using chloroform-methanol to give 2-(6,7-dimethoxy-quinolin-4-ylsulfanyl)-5-fluoro-benzoic acid (152 mg, yield 31%).

[0894] 2-(6,7-Dimethoxy-quinolin-4-ylsulfanyl)-5-fluoro-benzoic acid (76 mg) was suspended in ethanol (387 mg), and the suspension was cooled at 0°C. Thionyl chloride (50 mg) was gradually added dropwise thereto, and the mixture was then heated under reflux for 20 min. The solvent was removed by distillation under the reduced pressure, water was added to the residue, and the mixture was neutralized with a 20% aqueous sodium hydroxide solution and was then extracted with ethyl acetate. Next, the ethyl acetate layer was washed with water and saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-hexane to give the title compound (68 mg, 84%).

Compound 420: 6,7-Dimethoxy-4-(quinolin-2-ylsulfanyl)-quinoline

[0895] 2-Quinolinethiol (87 mg) and 4-chloro-6,7-dimethoxyquinoline (100 mg) were suspended in acetonitrile (3 ml), and the suspension was stirred at room temperature overnight. The solvent was removed by distillation under the reduced pressure. Water was added to the residue, and the mixture was neutralized with sodium hydrogencarbonate and was then extracted with chloroform. The chloroform layer was washed with water and saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-chloroform to give the title compound (15 mg, yield 10%).

Compound 421: 3-(6,7-Dimethoxy-quinolin-4-yloxy)-2-pyridin-2-yl-[1,8]naphthyridine

[0896] 2-Aminopyridine (14.1 g) and triethylamine (19.0 g) were dissolved in dichloromethane (200 ml) to prepare a solution which was cooled to 0°C. A solution of pivaloyl chloride (19.9 g) in dichloromethane (30 ml) was gradually added dropwise thereto, and the mixture was stirred at 0°C for 15 min. Thereafter, the reaction solution was stirred at room temperature for 4 hr. The reaction solution was poured into water (150 ml), and the dichloromethane layer was washed with a dilute aqueous sodium hydrogencarbonate solution and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using chloroform to give 2,2-dimethyl-N-pyridin-2-yl-propionamide (25.2 g, yield 95%).

[0897] 2,2-Dimethyl-N-pyridin-2-yl-propionamide (20.3 g) was dissolved in tetrahydrofuran (230 ml) to prepare a solution which was cooled to -78°C. A 2.44 M n-butyllithium/n-hexane solution (100 ml) was gradually added dropwise thereto, and the mixture was stirred at -78°C for 15 min. The reaction solution was stirred at 0°C for 2 hr and was then again cooled to -78°C. A solution of N,N-dimethylformamide (25.0 g) in tetrahydrofuran (25 ml) was gradually added dropwise thereto. The temperature of the reaction solution was raised to room temperature. The reaction solution was then poured into a mixture of ice (50 g) with 6 N hydrochloric acid (150 ml), and the mixture was stirred at room temperature for 20 min. The aqueous layer was neutralized with potassium carbonate powder and was extracted with diethyl ether, and the diethyl ether layer was then washed with water and saturated brine and was dried over magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using acetone-chloroform to give N-(3-formyl-pyridin-2-yl)-2,2-dimethyl-propionamide (11.8 g, yield 50%).

[0898] N-(3-Formyl-pyridin-2-yl)-2,2-dimethyl-propionamide (9.68 g) was dissolved in 3 N hydrochloric acid (140 ml), and the solution was stirred under reflux overnight. The reaction solution was cooled to room temperature, was then washed with diethyl ether, and was neutralized with potassium carbonate powder. Diethyl ether was added thereto, and the mixture was extracted. The diethyl ether layer was dried over potassium carbonate, and the solvent was removed by distillation under the reduced pressure. The residue was purified by column chromatography using acetone-chloroform to give 2-amino-pyridine-3-carbaldehyde (5.03 g, yield 88%).

[0899] 2-Amino-pyridine-3-carbaldehyde (200 mg) and 2-(bromoacetyl)pyridine hydrobromide (506 mg) were suspended in a 5 N aqueous sodium hydroxide solution (1 ml), and the suspension was hermetically sealed and, in this state, was allowed to stand for 2 days. The reaction solution was neutralized with 10% hydrochloric acid, dichloromethane was then added thereto, and the mixture was extracted. The dichloromethane layer was washed with water and saturated brine and was dried over magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using chloroform-methanol to give 2-pyridin-2-yl-[1,8]naphthyridin-3-ol (48 mg, yield 13%).

[0900] 2-Pyridin-2-yl-[1,8]naphthyridin-3-ol (9 mg), 4-chloro-6,7-dimethoxyquinoline (27 mg), and 4-dimethylaminopyridine (16 mg) were suspended in o-dichlorobenzene (1.5 ml), and the mixture was stirred at 140°C for 48 hr. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with chloroform. The chloroform layer was then washed with water and saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (2 mg, yield 12%).

Compound 425: 3-(6,7-Dimethoxy-quinolin-4-yloxy)-naphthalen-2-ol

[0910] Naphthalene-2,3-diol (1.00 g), 4-chloro-6,7-dimethoxyquinoline (691 mg), and 4-dimethylaminopyridine (1.14 g) were suspended in o-dichlorobenzene (20 ml), and the mixture was stirred at 130°C for one hr. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with chloroform. The chloroform layer was then washed with water and saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using chloroform-methanol to give the title compound (627 mg, yield 58%).

Compound 426: 2-Tert-butyl-3-(6,7-dimethoxy-quinolin-4-yloxy)-[1,8]naphthyridine

[0911] 2-Amino-pyridine-3-carbaldehyde (100 mg) and 1-bromo-3,3-dimethyl-butan-2-one (147 mg) were suspended in a 5 N aqueous sodium hydroxide solution (0.6 ml), and the suspension was hermetically sealed and, in this state, was allowed to stand for 3 days. The reaction solution was neutralized with 10% hydrochloric acid, and the resultant precipitate was then collected by filtration and was washed with water and chloroform. The powder as the residue was dried under the reduced pressure to give 2-tert-butyl-[1,8]naphthyridin-3-ol (40 mg, yield 24%).

[0912] 2-Tert-butyl-[1,8]naphthyridin-3-ol (40 mg), 4-chloro-6,7-dimethoxyquinoline (132 mg), and 4-dimethylaminopyridine (72 mg) were suspended in o-dichlorobenzene (3 ml), and the suspension was stirred at 140°C for 5.5 hr. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with chloroform. The chloroform layer was then washed with water and saturated brine and was dried over anhydrous magnesium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using chloroform-methanol to give the title compound (7 mg, yield 9%).

Compound 429: 3-(6,7-Dimethoxy-quinolin-4-yloxy)-5,6,3'-trimethyl-[2,2']bipyridine

[0917] 2-Bromo-3-methylpyridine (1.53 g) was dissolved in tetrahydrofuran (40 ml) under an argon atmosphere to prepare a solution. A 1.6M n-butyllithium/n-hexane solution (5.7 ml) was added dropwise to the solution at -78°C, and the mixture was then stirred at -78°C for 30 min. A solution of 4,5-dimethylfurfural (1.00 g) in tetrahydrofuran (20 ml) was added dropwise thereto, and the temperature of the mixture was raised to room temperature while stirring. Water was added to the reaction solution to stop the reaction. The solvent was removed by distillation under the reduced pressure, water was added to the residue, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using hexane-ethyl acetate to give (4,5-dimethylfuran-2-yl)-(3-methylpyridin-2-yl)-methanol (1.17 g, yield 61%).

[0918] (4,5-Dimethylfuran-2-yl)-(3-methylpyridin-2-yl)-methanol (1.17 g) was dissolved in chloroform (30 ml) to prepare a solution. Manganese dioxide (4.69 g) was added to the solution, and the mixture was stirred at room temperature overnight. The reaction solution was filtered through Celite, and the solvent was removed from the filtrate by distillation under the reduced pressure to give (4,5-dimethylfuran-2-yl)-(3-methylpyridin-2-yl)-methanone (940 mg, yield 81%).

[0919] (4,5-Dimethylfuran-2-yl)-(3-methylpyridin-2-yl)-methanone (930 mg), methanol (7.5 ml), and a 28% aqueous ammonia solution (9 ml) were placed in a sealed tube and was stirred at 160°C overnight. The reaction solution was cooled to room temperature, and the solvent was then removed by distillation under the reduced pressure, and the residue was purified by column chromatography using hexane-ethyl acetate to give 5,6,3'-trimethyl-[2,2']bipyridin-3-ol (109 mg, yield 86%).

[0920] Dimethyl sulfoxide (1.4 ml) was added to 5,6,3'-trimethyl-[2,2']bipyridin-3-ol (30 mg), 4-chloro-6,7-dimethoxyquinoline (94 mg), cesium carbonate (137 mg), and 4-(N,N-dimethylamino)-pyridine (51 mg), and the mixture was stirred at 140°C overnight. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using hexane-acetone to give the title compound (29 mg, yield 52%).

The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using hexane-ethyl acetate to give (4,5-dimethylfuran-2-yl)-(6-methoxypyridin-3-yl)-methanol (1.24 g, yield 60%).

[0922] (4,5-Dimethylfuran-2-yl)-(6-methoxypyridin-3-yl)-methanol (1.24 g) was dissolved in chloroform (30 ml) to prepare a solution. Manganese dioxide (4.63 g) was added to the solution, and the mixture was stirred at room temperature overnight. Manganese dioxide (4.63 g) was then added to the reaction solution, and the mixture was stirred for 6 hr. The reaction solution was filtered through Celite, and the solvent was removed from the filtrate by distillation under the reduced pressure to give (4,5-dimethylfuran-2-yl)-(6-methoxypyridin-3-yl)-methanone (655 mg, yield 53%).

[0923] (4,5-Dimethylfuran-2-yl)-(6-methoxypyridin-3-yl)-methanone (650 mg), methanol (6 ml), and a 28% aqueous ammonia solution (6 ml) were placed in a sealed tube and was stirred at 160°C overnight. The reaction solution was cooled to room temperature, the solvent was then removed by distillation under the reduced pressure, and the residue was purified by column chromatography using hexane-ethyl acetate to give 6'-methoxy-5,6-dimethyl-[2,3']bipyridin-3-ol (109 mg, yield 86%).

[0924] 1,2-Dichlorobenzene (1.3 ml) was added to 6'-methoxy-5,6-dimethyl-[2,3']bipyridin-3-ol (30 mg), 4-chloro-6,7-dimethoxyquinoline (88 mg), and 4-(N,N-dimethylamino)-pyridine (48 mg), and the mixture was stirred at 140°C overnight. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (12 mg, yield 23%).

Compound 438: 6,7-Dimethoxy-4-[6-methyl-2-(1-methyl-1H-pyrazol-4-yl)-pyridin-3-yloxy]-quinoline

[0935] 6,7-Dimethoxy-4-[6-methyl-2-(1H-pyrazol-4-yl)-pyridin-3-yloxy]-quinoline (compound 434) (30 mg) was suspended in N,N-dimethylformamide (1 ml), 60% sodium hydride (9.9 mg) was added to the suspension, and the mixture was then stirred for 30 min. Methyl iodide (18 mg) was added to the reaction solution, and the mixture was stirred for one hr. Water was added to the reaction solution to stop the reaction, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was washed with water and was then dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure. The residue was purified by thin layer chromatography using hexane-acetone to give the title compound (23 mg, yield 73%).

Mass spectrometric value (ESI-MS, m/z): 377 (M+1)⁺

Compound 439: 6,7-Dimethoxy-4-[2-(3-methyl-butyl)-quinolin-3-yloxy]-quinoline

[0936] 4-[2-(5-Chloro-4-methyl-thiophen-2-yl)-quinolin-3-yloxy]-6,7-dimethoxy-quinoline (compound 290) (7 mg) was dissolved in triethylamine/N,N-dimethylformamide (0.5 ml/1.5 ml) to prepare a solution, 20% palladium hydroxide (68 mg) was added to the solution, and the mixture was stirred under a hydrogen gas atmosphere at room temperature overnight. The reaction solution was filtered, and the solvent was then removed by distillation under the reduced pressure. Water was added to the residue, and the mixture was extracted with ethyl acetate. The ethyl acetate layer was then washed with water and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using acetone-chloroform to give the title compound (3.6 mg, yield 56%).

Compound 440: 3-[6-Methoxy-7-(2-piperidin-1-yl-ethoxy)-quinolin-4-yloxy]-2-methyl-[1,8]naphthyridine

[0937] 3-[7-Hydroxy-6-methoxy-quinolin-4-yloxy]-2-methyl-[1,8]naphthyridine (67 mg) was dissolved in N,N-dimethylformamide (5 ml) to prepare a solution. Potassium carbonate (225 mg) and 1-bromo-2-chloroethane (0.15 ml) were added to the solution, and the mixture was stirred at room temperature overnight. Potassium carbonate (300 mg) and piperidine (0.5 ml) were added to the reaction solution, and the mixture was further stirred at 70°C overnight. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with chloroform. The chloroform layer was washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (69 mg, yield 78%) (2 steps).

Compound 441: 3-[6-Methoxy-7-(2-morpholin-4-yl-ethoxy)-quinolin-4-yloxy]-2-methyl-[1,8]naphthyridine

[0938] 3-[7-Hydroxy-6-methoxy-quinolin-4-yloxy]-2-methyl-[1,8]naphthyridine (67 mg) was dissolved in N,N-dimethylformamide (5 ml) to prepare a solution. Potassium carbonate (225 mg) and 1-bromo-2-chloroethane (0.15 ml) were added to the solution, and the mixture was stirred at room temperature overnight. Morpholine (0.3 ml) was added to the reaction solution, and the mixture was further stirred overnight at 70°C. Potassium carbonate (354 mg) and morpholine (0.2 ml) were further added to the reaction solution, and the mixture was stirred at 70°C overnight. The reaction solution was cooled to room temperature, water was then added to the reaction solution, and the mixture was extracted with chloroform. The chloroform layer was washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (11 mg, yield 12%) (2 steps).

Compound 443: 6-Methoxy-4-(5,6,6'-trimethyl-[2,2']bipyridin-3-yloxy)-quinolin-7-ol

[0940] 3-(7-Benzyloxy-6-methoxy-quinolin-4-yloxy)-5,6,6'-trimethyl-[2,2']bipyridine (compound 442) (475 mg) was dissolved in trifluoroacetic acid (4.7 ml) to prepare a solution. Methanesulfonic acid (0.47 ml) was added to the solution, and the mixture was stirred at 70°C for one hr. The reaction solution was cooled to room temperature, and the solvent was removed by distillation under the reduced pressure. An aqueous sodium hydrogencarbonate solution was then added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by column chromatography using chloroform-methanol to give the title compound (433 mg, yield 100%).

The solvent was removed by distillation under the reduced pressure, water was then added to the residue, and the mixture was extracted with chloroform. The chloroform layer was washed with saturated brine and was dried over anhydrous sodium sulfate. The solvent was removed by distillation under the reduced pressure, and the residue was purified by thin layer chromatography using chloroform-methanol to give the title compound (25 mg, yield 71%).

Evaluation tests

Test Example 1: TGFβ signal inhibitory activity (in vitro test)

[0967] The TGFβ signal inhibitory activity of compounds according to the present invention was evaluated according to the method described in J. Boil. Chem., 273, 21145-21152 (1998).

[0968] Specifically, a luciferase gene driving by four tandem binding sequences of Smad2/3, which are TGFβ signal transfer factors was used as a reporter gene ((SBE)4-Luc). This reporter gene was introduced into human lung cancer epithelial cells (A549) (available from ATCC) to establish a stable cell line expressing its gene.

[0969] A test compound and TGFβ-1 (2 ng/ml) were added to the cells, and the mixture was cultured for 4 hr. Compounds according to the present invention synthesized in the above working examples were used as the test compound. After the culture, the luciferase activity of cells was measured by a chemiluminescence method (Steady Glo (trademark) luciferase assay system available from Promega).

[0970] Likewise, the luciferase activity was measured for control cells, that is, cells which had been cultured with the addition of TGFβ only, and cells which had been cultured without the addition of TGFβ and the test compound.

[0971] The TGFβ inhibition rate (%) was calculated based on the results of measurement according to the following equation:

$$\text{TGF}\beta \text{ inhibition rate (\%)} = (A - B)/(A - C) \times 100$$

wherein A, B and C have the following respective meanings:

A: luciferase activity in the case where TGFβ1 was added and the test compound was not added (relative luciferase unit);

B: luciferase activity in the case where both TGFβ1 and the test compound were added (relative luciferase unit); and

C: luciferase activity in the case where neither TGFβ1 nor the test compound was added (relative luciferase unit).

[0972] The test was carried out for each of a test compound concentration of 3 μM and a test compound concentration of 10 μM. For given test compounds, the test was further carried out for a test compound concentration of 1 μM.

[0973] The results were as shown in Table 1.

[0974] The results show that the compounds according to the present invention have activity which counteracts the action of TGFβ.

Test Example 2: Measurement of fibrotic inhibitory activity using mouse unilateral ureteral obstruction (UUO) model

[0975] The fibrotic inhibitory activity of a compound according to the present invention was evaluated using a mouse unilateral ureteral obstruction (UUO) model which is a renal fibrosis model. Compound 384 prepared in the working example was used as the test compound.

[0976] Seven-week-old male BALB/c mice (available from Charles River Japan, Inc.) were purchased and were pre-raised before use in experiments. Regarding diets and drinking water, pellets CE-2 (available from CLEA JAPAN INC.) and sterile tap water were freely fed.

[0977] The mice underwent laparotomy under pentobarbital anesthesia, and the left renal urinary duct was ligated. Thereafter, the mice underwent suturing operation and were divided into a vehicle administration group (n = 7) and a test compound administration group (n = 7) using the weight as an index.

[0978] The test compound was weighed, and then one drop of 1 N HCl was added to the test compound to prepare a solution. The solution was then suspended in 0.5% carboxymethylcellulose (solvent). The suspension was forcibly orally administered twice a day with an oral sonde from the day of urinary duct ligation (5, 15, or 50 mg/kg). The solvent was administered to the vehicle administration group in the same manner as described just above.

[0979] After administration for 4 days, the mouse left kidney was excised, and the hydroxyproline content as an index of organ fibrosis was measured by the following method.

[0980] Renal pieces were placed in 6 N HCl, were homogenized, and were then heated on a heat block at 130°C for 3 hr to hydrolyze protein. Thereafter, the suspension of renal pieces was neutralized by the addition of an appropriate amount of 4 N NaOH. The neutralized suspension was centrifuged (1000 rpm, 5 min, room temperature) to obtain the supernatant as a kidney extract. A chloramine T liquid, a perchloric acid solution (a solution prepared by adding distilled water to 31.5 ml of 60% perchloric acid to bring the total volume to 100 ml), and a p-dimethylaminobenzaldehyde

solution (a solution prepared by adding methylcellulose to 20 g of p-dimethylaminobenzaldehyde to bring the total volume to 100 ml) were added to the kidney extract, and a reaction was allowed to proceed at 60°C for 20 min. The absorbance at 557 nm was then measured. The content of hydroxyproline was determined from the measured data based on a calibration curve for hydroxyproline prepared using control. Further, the content of hydroxyproline thus determined was corrected according to the weight of the homogenized kidney.

[0981] The results were as shown in Table 2. The values in the table are average of data on 7 mice for each group \pm standard deviation.

[0982] As a result, it was found that, as compared with the kidney of normal mice, for the mouse kidney for which the left renal urinary duct had been ligated, the content of hydroxyproline was increased and extracellular substrate accumulated within the kidney. As compared with the solvent administration group, for the group to which the compound according to the present invention had been administered, the content of hydroxyproline was lowered, indicating that the compound according to the present invention could suppress the accumulation of extracellular matrix proteins in the kidney.

Table 2:

Administration group	Hydroxyproline content (mg/g)
Normal mice	392.9 \pm 10.8
UUO treatment + solvent	549.4 \pm 15.2 ###
UUO treatment + compound 384 (5 mg/kg)	514.4 \pm 20.8
UUO treatment + compound 384 (15 mg/kg)	487.7 \pm 10.9 **
UUO treatment + compound 384 (50 mg/kg)	425.7 \pm 14.2 ***
[In the table, ### indicates that $p < 0.001$ in Student's t-test against the normal mouse group, and ** and *** respectively indicate that $p < 0.01$ and $p < 0.001$ in Student's t-test against UUO treatment + solvent group.	

Test Example 3: Measurement of fibrotic inhibitory activity using mouse unilateral ureteral obstruction (UUO) model

[0983] The fibrotic inhibitory activity of a compound according to the present invention was evaluated using the same model as used in Test Example 2. Compound 320 prepared in the working example was used as the test compound.

[0984] The experiment method and evaluation method were the same as those in Test Example 2, except that the compound administration was carried out by feeding a diet mixed with the compound for 10 days and the correction of hydroxyproline content was changed to the content of protein in the kidney extract.

[0985] The results were as shown in Table 3. The values in the table are average of data on five mice for each group \pm standard deviation.

[0986] As a result, it was found that, as compared with the solvent administration group, for the group to which the compound according to the present invention had been administered, the content of hydroxyproline was significantly lowered, indicating that the compound according to the present invention could suppress the accumulation of extracellular matrix proteins in the kidney.

Table 3:

Administration group	Hydroxyproline content
	(mg/g protein)
Normal mice	6.7 \pm 1.26
UUO treatment + solvent	12.7 \pm 1.14 #
UUO treatment + compound 320 (0.1% mixed diet)	9.44 \pm 0.53 *
UUO treatment + compound 320 (0.3% mixed diet)	9.19 \pm 0.38 *
[In the table, # indicates that $p < 0.05$ in Student's t-test against the normal mouse group, and ** indicates that $p < 0.05$ in Student's t-test against UUO treatment + solvent group.	

Test Example 4: Measurement of fibrotic inhibitory activity using mouse DMN hepatic fibrosis model

[0987] The fibrotic inhibitory activity of a compound according to the present invention was evaluated using a mouse DMN hepatic fibrosis model as a liver fibrosis model. Compound 384 prepared in the working example was used as the test compound.

[0988] Six-week-old male BALB/c mice (available from Charles River Japan, Inc.) were purchased and were pre-

raised before use in experiments.

[0989] The mice were divided into a vehicle administration group (n = 6) and a test compound administration group (n = 7) using the weight as an index. Thereafter, dimethylnitrosoamine (DMN) diluted with physiological saline was intraperitoneally administered at 15 mg/kg three times per week for 3 weeks to induce hepatic fibrosis.

[0990] The administration of the test compound was carried out from the first day of the DMN administration. The test compound was mixed in amounts of 0.015, 0.03, and 0.06% in powder diet CE-2 (available from CLEA JAPAN INC.), and the mixtures were fed as a diet to each mouse group.

[0991] After 21 days, the mice underwent laparotomy under ether anesthesia, and blood was collected from the heart, followed by measurement of the level of hyaluronic acid in blood as an index of hepatic fibrosis with a hyaluronic acid plate (Chugai Pharmaceutical Co., Ltd.).

[0992] The results were as shown in Table 3. The values in the table are average of data on 6 mice for each group \pm standard deviation.

[0993] As a result, it was found that, as compared with the liver of normal mice, for the mouse liver to which DMN had been administered, the hyaluronic acid level of blood was increased and extracellular matrix proteins accumulated within the liver. As compared with the solvent administration group, for the group to which the compound according to the present invention had been administered, the hyaluronic acid level of blood was lowered, indicating that the compound according to the present invention could suppress the accumulation of extracellular matrix proteins in the liver.

Table 4:

Administration group	Hyaluronic acid level of blood (ng/ml)
Normal mice	113.8 \pm 14.9
DMN administration + solvent	326.4 \pm 47.1 ##
DMN administration + compound 384 (0.015% mixed diet)	167.8 \pm 25.0 *
DMN administration + compound 384 (0.03% mixed diet)	108.5 \pm 9.0 **
DMN administration + compound 384 (0.06% mixed diet)	97.2 \pm 11.0**
[In the table, ## indicates that p < 0.01 in Student's t-test against the normal mouse group, and * and ** respectively indicate that p < 0.05 and p < 0.01 in Student's t-test against UUO treatment + solvent group.]	

Claims

1. A compound represented by formula (I) or a pharmaceutically acceptable salt or solvate thereof:

wherein

X represents CH or N,

Z represents -O-, -NH-, -S-, or -C(=O)-,

R and R', which may be the same or different, represent

1) a hydrogen atom,

2) a halogen atom,

3) C₁₋₆ alkyl optionally substituted by hydroxyl, a halogen atom, or a saturated or unsaturated five- or six-membered heterocyclic group,

4) C₂₋₆ alkenyl optionally substituted by an oxygen atom or C₁₋₄ alkoxy,

5) amino in which one or two hydrogen atoms on the amino group are optionally substituted by C₁₋₆ alkyl, and the C₁₋₆ alkyl group is optionally substituted by hydroxyl or a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group,

6) $-C(=O)-NH_2$ wherein one or two hydrogen atoms on the aminocarbonyl group are optionally substituted by C_{1-6} alkyl, 7) $-OR^*$ wherein R^* represents a hydrogen atom, or $-(CH_2)_m-R^a$ wherein R^a represents a hydrogen atom, a halogen atom, hydroxyl, a saturated or unsaturated three- to six-membered carbocyclic or heterocyclic group, C_{1-4} alkoxy, C_{1-4} alkoxycarbonyl, or $-NR^bR^c$ wherein R^b and R^c , which may be the same or different, represent a hydrogen atom or C_{1-6} alkyl, in which the C_{1-6} alkyl group is optionally substituted by hydroxyl, an oxygen atom, amino, a nitrogen atom, or C_{1-4} alkyl, and R^b and R^c may combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or six-membered heterocyclic group, which may further comprise one or more heteroatoms, and in which the heterocyclic group is optionally substituted by C_{1-4} alkyl optionally substituted by hydroxyl, hydroxyl, an oxygen atom, aminocarbonyl, C_{1-4} alkoxy, C_{1-4} alkoxycarbonyl, or a saturated or unsaturated five- or six-membered heterocyclic group, and the heterocyclic group may condense with another saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group to form a bicyclic group; m is an integer of 1 to 6; and the alkyl chain part in this group, $-(CH_2)_m-$, is optionally substituted by hydroxyl, an oxygen atom, $-OR^d$ group, wherein R^d represents C_{1-4} alkyl or C_{1-4} alkylcarbonyl, or C_{1-4} alkyl optionally substituted by hydroxyl or a halogen atom, or

8) a saturated or unsaturated five- or six-membered heterocyclic group, and

A represents any group selected from the group consisting of formulae (a) to (c):

(a) a group of formula (a):

wherein

R^3 to R^6 , which may be the same or different, represent

a hydrogen atom,

hydroxyl,

a halogen atom,

C_{1-6} alkyl,

C_{1-10} alkoxy optionally substituted by a halogen atom or phenyl,

C_{2-6} alkenylcarbonyloxy,

C_{1-4} alkylcarbonyl,

C_{1-4} alkylthio, or

phenyl optionally substituted by a halogen atom,

R^3 and R^4 , R^4 and R^5 , and R^5 and R^6 each may combine with a carbon atom attached thereto to form a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by a hydrogen atom, a halogen atom, hydroxyl, or C_{1-4} alkyl,

G represents

$-C(=O)-R^7$,

$-CH_2-N(-R^{11})R^{12}$, or

$-C(-R^{13})(=NR^{14})$,

wherein

R^7 represents

a hydrogen atom,

C_{1-8} alkyl optionally substituted by C_{1-4} alkoxy, an oxygen atom, or a saturated or unsaturated five- or six-membered carbocyclic group,

C_{2-6} alkenyl optionally substituted by a saturated or unsaturated five- or six-membered carbocyclic group,

a saturated or unsaturated five- or six-membered carbocyclic group or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by hydroxyl, C_{1-4} alkyl, or C_{1-4} alkoxy, and the C_{1-4} alkoxy group is optionally substituted by a halogen atom or a saturated or unsaturated five- or

six-membered heterocyclic group,

group -O-R⁸, or
group -N(-R⁹)R¹⁰

wherein

R⁸ represents

C₁₋₁₀ alkyl optionally substituted by a saturated or unsaturated five- or six-membered carbocyclic group,

C₂₋₈ alkenyl, or

a saturated or unsaturated five- or six-membered carbocyclic group in which the carbocyclic group is optionally substituted by a halogen atom,

R⁹ and R¹⁰, and R¹¹ and R¹², which may be the same or different, each represent

a hydrogen atom,

C₁₋₆ alkyl,

a saturated or unsaturated five- or six-membered carbocyclic group in which the carbocyclic group is optionally substituted by a halogen atom, or

naphthyl optionally substituted by a halogen atom,

R⁹ and R¹⁰, or R¹¹ and R¹² may combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or six-membered heterocyclic group which may further comprise one or more heteroatoms and in which the heterocyclic group is optionally substituted by C₁₋₄ alkyl optionally substituted by hydroxyl, or a saturated or unsaturated five- or six-membered heterocyclic group,

R¹³ represents

a hydrogen atom or

C₁₋₄ alkyl,

R¹⁴ represents

a hydrogen atom,

hydroxyl,

C₁₋₄ alkoxy optionally substituted by a saturated or unsaturated six-membered carbocyclic group,

C₂₋₆ alkenyloxy,

phenyloxy, or

amino optionally substituted by a saturated or unsaturated six-membered heterocyclic group,

(b) a group of formula (b):

(b)

wherein

any one of J, L, and M represents a nitrogen atom with the remaining two representing a carbon atom, R¹⁵ to R¹⁹, which may be the same or different, represent

a hydrogen atom,

a halogen atom,

nitro,

cyano,

C₁₋₆ alkyl in which the alkyl group is optionally substituted by hydroxyl; phenyl; amino optionally substituted by C₁₋₄ alkyl; C₁₋₄ alkylcarbonyloxy; or a saturated or unsaturated six-membered heterocyclic group optionally substituted by C₁₋₄ alkyl,

C₁₋₈ alkoxy,

C₁₋₄ alkylcarbonyl,

C_{2-6} alkenyl optionally substituted by a saturated or unsaturated five- or six-membered carbocyclic group,
 C_{2-6} alkynyl optionally substituted by C_{1-4} alkylsilyl,
 C_{1-4} alkylthio,
 a saturated or unsaturated three- to eight-membered carbocyclic oxy group,
 a saturated or unsaturated six-membered carbocyclic carbonyl or heterocyclic carbonyl group optionally
 substituted by C_{1-4} alkyl, or
 a saturated or unsaturated three- to eight-membered carbocyclic or heterocyclic group in which the car-
 bocyclic or heterocyclic group is optionally substituted by hydroxyl; cyano; a halogen atom; C_{1-4} alkoxy; phe-
 nyloxy; C_{1-4} alkylcarbonyl; amino optionally substituted by C_{1-4} alkyl or C_{1-4} alkylcarbonyl; aminocarbonyl
 optionally substituted by C_{1-4} alkyl; or C_{1-4} alkyl optionally substituted by hydroxyl or a halogen atom,
 R^{15} and R^{16} , R^{16} and R^{17} , R^{17} and R^{18} , and R^{18} and R^{19} each may combine with a carbon atom attached
 thereto to form a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group, and the
 carbocyclic or heterocyclic group is optionally substituted by C_{1-4} alkyl,
 provided that, among R^{17} to R^{19} , those in which J, L, or M attached thereto is a nitrogen atom are absent,
 and
 (c) a group of formula (c):

(c)

wherein

R^{20} to R^{24} , which may be the same or different, represent
 a hydrogen atom,
 a halogen atom,
 C_{1-10} alkyl optionally substituted by hydroxyl, a saturated or unsaturated five- or six-membered carbo-
 cyclic or heterocyclic group,
 C_{1-8} alkoxy,
 C_{2-6} alkenyl optionally substituted by C_{1-4} alkyl, C_{1-4} alkoxy, an oxygen atom or phenyl,
 phenylcarbonyl optionally substituted by C_{1-4} alkyl,
 amino optionally substituted by phenyl,
 nitro, or
 a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group in which the carbo-
 cyclic or heterocyclic group is optionally substituted by C_{1-6} alkyl,
 R^{20} and R^{21} , or R^{23} and R^{24} may combine with a carbon atom attached thereto to form a saturated or
 unsaturated five- or six-membered carbocyclic or heterocyclic group, and
 R^{21} and R^{22} , or R^{22} and R^{23} may combine with a carbon atom attached thereto to form a saturated or
 unsaturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic
 group is optionally substituted by a halogen atom, C_{1-4} alkyl, C_{1-4} alkylcarbonyl, C_{1-6} alkoxycarbonyl, or an
 oxygen atom, and the carbocyclic or heterocyclic group may condense with another saturated or unsaturated
 five- or six-membered carbocyclic or heterocyclic group to form a tricyclic group together with the six-mem-
 bered carbocyclic ring of formula (c).

2. The compound according to claim 1, represented by formula (II), or a pharmaceutically acceptable salt or solvate thereof:

wherein

X, Z, and A are as defined in claim 1,

R¹ and R², which may be the same or different, represent a hydrogen atom, or -(CH₂)_m-R^a wherein R^a represents a hydrogen atom, a halogen atom, hydroxyl, a saturated or unsaturated three- to six-membered carbocyclic or heterocyclic group, C₁₋₄ alkoxy, C₁₋₄ alkoxycarbonyl, or -NR^bR^c wherein R^b and R^c, which may be the same or different, represent a hydrogen atom or C₁₋₆ alkyl, in which the C₁₋₆ alkyl group is optionally substituted by hydroxyl, an oxygen atom, amino, a nitrogen atom, or C₁₋₄ alkyl, and R^b and R^c may combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or six-membered heterocyclic group, which may further comprise one or more heteroatoms, and in which the heterocyclic group is optionally substituted by C₁₋₄ alkyl, optionally substituted by hydroxyl, hydroxyl, an oxygen atom, aminocarbonyl, C₁₋₄ alkoxy, C₁₋₄ alkoxycarbonyl, or a saturated or unsaturated five- or six-membered heterocyclic group, and the heterocyclic group may condense with another saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group to form a bicyclic group; m is an integer of 1 to 6; and the alkyl chain part in this group, -(CH₂)_m-, is optionally substituted by hydroxyl, an oxygen atom, -OR^d group, wherein R^d represents C₁₋₄ alkyl or C₁₋₄ alkylcarbonyl, or C₁₋₄ alkyl optionally substituted by hydroxyl or a halogen atom.

3. The compound according to claim 2, wherein

R¹ and R², which may be the same or different, represent any group selected from the group consisting of a hydrogen atom, C₁₋₆ alkyl optionally substituted by phenyl, and groups of formulae (i) to (vi):

(i) a group of formula (i):

wherein

R⁵¹ and R⁵², which may be the same or different, represent a hydrogen atom, or

C₁₋₈ alkyl optionally substituted by hydroxyl, an oxygen atom, amino, or a nitrogen atom,

R⁵¹ and R⁵² may combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or six-membered heterocyclic group which may further comprise one or more heteroatoms, and in which the heterocyclic group is optionally substituted by C₁₋₄ alkyl optionally substituted by hydroxyl, hydroxyl, an oxygen atom, aminocarbonyl, C₁₋₄ alkoxy, C₁₋₄ alkoxycarbonyl, or a saturated or unsaturated five- or six-membered heterocyclic group, and the heterocyclic group optionally formed by allowing R⁵¹ to combine with R⁵² may condense with another saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group to form a bicyclic group,

p is an integer of 2 to 4, and

the alkyl chain part in this group is optionally substituted by hydroxyl, or -OR^e group wherein R^e represents C₁₋₄ alkyl or C₁₋₄ alkylcarbonyl,

(ii) a group of formula (ii):

wherein q is an integer of 1 to 4,

(iii) a group of formula (iii):

wherein Hal represents a halogen atom, and

r represents an integer of 2 to 4,

(iv) a group of formula (iv):

wherein

R⁵³ and R⁵⁴, which may be the same or different, represent a hydrogen atom, or

C₁₋₆ alkyl optionally substituted by hydroxyl,

R⁵³ and R⁵⁴ may combine with a nitrogen atom attached

thereto to form a saturated or unsaturated five- or six-membered heterocyclic group which may further comprise one or more heteroatoms and in which the heterocyclic group is optionally substituted by C₁₋₄ alkyl optionally substituted by hydroxyl, or a saturated or unsaturated five- or six-membered heterocyclic group, and the heterocyclic group optionally formed by allowing R⁵³ to combine with R⁵⁴ may condense with another saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group to form a bicyclic group, and

s is an integer of 0 to 3,

(v) a group of formula (v):

wherein

R⁵⁵ represents C₁₋₄ alkyl and

t is an integer of 0 (zero) to 3, and

(vi) a group of formula (vi):

10 wherein

R⁵⁶, R⁵⁷ and R⁵⁸, which may be the same or different, represent
 a hydrogen atom,
 C₁₋₄ alkoxy carbonyl, or
 C₁₋₄ alkyl optionally substituted by hydroxyl or a halogen atom, and
 u is an integer of 0 (zero) to 4.

15 4. The compound according to claim 3, wherein formula (i) is represented by formula (i-a):

25 5. The compound according to claim 3 or 4, wherein

R¹ and R², which may be the same or different, represent any group selected from the group consisting of
 a hydrogen atom,
 C₁₋₆ alkyl,
 benzyl,
 groups of formulae (i), (v), and (vi) according to claim 3, and
 groups of formulae (ii-a), (iii-a), and (iv-a):

30 • formula (ii-a):

40 • formula (iii-a):

wherein r₁ is an integer of 2 to 4, and

50 • formula (iv-a):

6. The compound according to claim 5, wherein one of R¹ and R² is selected from C₁₋₆ alkyl, and the other substituent is selected from the group consisting of
 a hydrogen atom,
 benzyl,
 groups of formulae (i), (v), and (vi) according to claim 3, and
 groups of formulae (ii-a), (iii-a), and (iv-a) according to claim 5.
7. The compound according to claim 1, wherein
 at least one of R and R' is selected from the group consisting of
 a hydrogen atom,
 a halogen atom,
 C₁₋₄ alkyl optionally substituted by hydroxyl, a halogen atom, or a saturated or unsaturated five- or six-membered heterocyclic group,
 C₂₋₄ alkenyl optionally substituted by an oxygen atom or C₁₋₄ alkoxy,
 amino in which one or two hydrogen atoms on the amino group are optionally substituted by C₁₋₄ alkyl, and
 the C₁₋₄ alkyl group is optionally substituted by hydroxyl or a saturated or unsaturated five- or six-membered heterocyclic group,
 -C(=O)-NH₂, and
 a saturated or unsaturated five- or six-membered heterocyclic group.
8. The compound according to claim 1, wherein
 R' is selected from the group consisting of
 a hydrogen atom,
 a halogen atom,
 C₁₋₄ alkyl optionally substituted by hydroxyl, a halogen atom, or a saturated or unsaturated five- or six-membered heterocyclic group,
 C₂₋₄ alkenyl optionally substituted by an oxygen atom or C₁₋₄ alkoxy,
 amino in which one or two hydrogen atoms on the amino group are optionally substituted by C₁₋₄ alkyl, and
 the C₁₋₄ alkyl group is optionally substituted by hydroxyl or a saturated or unsaturated five- or six-membered heterocyclic group,
 -C(=O)-NH₂, and
 a saturated or unsaturated five- or six-membered heterocyclic group.
9. The compound according to any one of claims 1 to 8, wherein formula (a), which A may represent, represents any group selected from the group consisting of formulae (a1) to (a3):

(1) a group of formula (a1):

wherein

R³, R⁴ and R⁶, which may be the same or different, represent
 a hydrogen atom,
 a halogen atom,
 C₁₋₆ alkyl,
 C₁₋₁₀ alkoxy optionally substituted by a halogen atom or phenyl,
 C₂₋₆ alkenylcarbonyloxy,
 C₁₋₄ alkylcarbonyl, or
 phenyl optionally substituted by a halogen atom,

R⁵ is as defined in claim 1,
 R³ and R⁴, R⁴ and R⁵, and R⁵ and R⁶ each may combine with a carbon atom attached thereto to form
 a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group, and

R⁷ is as defined in claim 1,

(2) a group of formula (a2):

wherein

R³ to R⁶ are as defined in formula (a1),

R¹¹ and R¹² are as defined in claim 1, and

(3) a group of formula (a3):

wherein

R^{3a} to R^{6a}, which may be the same or different, represent

a hydrogen atom,

a halogen atom, or

C₁₋₆ alkyl, and

R¹³ and R¹⁴ are as defined in claim 1.

10. The compound according to claim 9, wherein A represents a group of formula (a1) and at least one of R³ to R⁶ in formula (a1) is selected from groups other than a hydrogen atom.

11. The compound according to claim 9 or 10, wherein A represents a group of formula (a1) and R⁷ in formula (a1) represents a hydrogen atom, C₁₋₄ alkyl, or phenyl in which the phenyl group is optionally substituted by hydroxyl, C₁₋₄ alkyl, or C₁₋₄ alkoxy.

12. The compound according to claim 9 or 10, wherein A represents a group of formula (a1) and R⁷ in formula (a1) represents group -O-R⁸ or group -N(-R⁹)R¹⁰.

13. The compound according to claim 12, wherein R⁸ represents unsubstituted C₁₋₈ alkyl; C₁₋₄ alkyl substituted by phenyl; C₂₋₈ alkenyl; or phenyl optionally substituted by a halogen atom.

14. The compound according to claim 12, wherein

at least one of R⁹ and R¹⁰ represents a hydrogen atom and the other substituent represents a hydrogen atom,

C₁₋₆ alkyl,

a saturated or unsaturated five- or six-membered

carbocyclic group in which the carbocyclic group is optionally substituted by a halogen atom, or naphthyl optionally substituted by a halogen atom, or

R⁹ and R¹⁰ combine with a nitrogen atom attached thereto to form a saturated five- or six-membered heterocyclic group in which the heterocyclic group may further comprise at least one heteroatom.

15. The compound according to any one of claims 9 to 14, wherein A represents a group of formula (a1) and R⁵ in formula (a1) is selected from groups other than a hydrogen atom.

16. The compound according to any one of claims 10 to 15, wherein R and R¹ are selected from -OR^{*} wherein R^{*} represents C₁₋₆ alkyl.

17. The compound according to claim 9, wherein A represents a group of formula (a2) and R¹¹ and R¹² in formula (a2) combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or six-membered heterocyclic group in which the heterocyclic group may further comprise one or more heteroatoms and is optionally substituted by C₁₋₄ alkyl optionally substituted by hydroxyl; or a saturated five- or six-membered heterocyclic group.

18. The compound according to claim 17, wherein A represents a group of formula (a2) and, in formula (a2), R³, R⁴, and R⁶ represent a hydrogen atom, hydroxyl, or a halogen atom, and R⁵ represents C₁₋₄ alkyl.

19. The compound according to claim 9, wherein A represents a group of formula (a3) and, in formula (a3), R¹³ represents methyl, and R¹⁴ represents hydroxyl; C₁₋₄ alkoxy optionally substituted by phenyl; C₂₋₆ alkenyloxy; phenyloxy; or amino optionally substituted by a six-membered unsaturated heterocyclic group.

20. The compound according to claim 9 or 19, wherein A represents a group of formula (a3), and, in formula (a3), R^{3a} and R^{6a} represents a hydrogen atom, and R^{4a} and R^{5a} represent C₁₋₆ alkyl.

21. The compound according to claim 1, wherein A is selected from groups of formula (a) or (b).

22. The compound according to any one of claims 1 to 8, wherein formula (b), which A may represent, represents any group selected from the group consisting of formulae (b1) to (b3):

(4) a group of formula (b1):

wherein

R²⁵ to R²⁷, which may be the same or different, represent

a hydrogen atom,

a halogen atom,

C₁₋₆ alkyl,

C₁₋₈ alkoxy,

C₁₋₄ alkylcarbonyl,
 C₁₋₄ alkylthio, or
 phenylcarbonyl,
 R²⁵ and R²⁶, and R²⁶ and R²⁷ each may combine with a carbon atom attached thereto to form a saturated
 or unsaturated five- or six-membered carbocyclic or heterocyclic group,
 R²⁸ represents
 a hydrogen atom,
 a halogen atom,
 nitro,
 cyano,
 C₁₋₆ alkyl in which the alkyl group is optionally substituted by hydroxyl; phenyl; amino optionally substi-
 tuted by C₁₋₄ alkyl; C₁₋₄ alkylcarbonyloxy; or a saturated or unsaturated six-membered heterocyclic group
 optionally substituted by C₁₋₄ alkyl,
 C₁₋₈ alkoxy,
 C₁₋₄ alkylcarbonyl,
 C₂₋₆ alkenyl optionally substituted by a saturated or unsaturated six-membered carbocyclic group,
 C₂₋₆ alkynyl optionally substituted by C₁₋₂ alkylsilyl,
 a saturated or unsaturated three- to eight-membered carbocyclic oxy group,
 a saturated or unsaturated six-membered carbocyclic carbonyl or heterocyclic carbonyl group optionally
 substituted by C₁₋₄ alkyl, or
 a saturated or unsaturated three- to eight-membered carbocyclic or heterocyclic group in which the car-
 bocyclic or heterocyclic group is optionally substituted by hydroxyl; cyano; a halogen atom; C₁₋₄ alkoxy; phe-
 nyloxy; C₁₋₄ alkylcarbonyl; amino optionally substituted by C₁₋₄ alkyl or C₁₋₄ alkylcarbonyl; aminocarbonyl
 optionally substituted by C₁₋₄ alkyl; or C₁₋₄ alkyl optionally substituted by hydroxyl or a halogen atom,
 (5) a group of formula (b2):

wherein
 R²⁹ to R³², which may be the same or different, represent a hydrogen atom,
 a halogen atom, or
 C₁₋₆ alkyl optionally substituted by hydroxyl,
 R²⁹ and R³⁰, and R³¹ and R³² each may combine with a carbon atom attached thereto to form a saturated
 or unsaturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic
 group is optionally substituted by a halogen atom or C₁₋₄ alkyl, and
 (6) a group of formula (b3):

wherein

R³³ to R³⁶, which may be the same or different, represent a hydrogen atom, a halogen atom, or

C₁₋₆ alkyl optionally substituted by hydroxyl,

R³³ and R³⁴, R³⁴ and R³⁵, and R³⁵ and R³⁶ each may combine with a carbon atom attached thereto to form a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by a halogen atom or C₁₋₄ alkyl.

23. The compound according to claim 22, wherein A represents a group of formula (b1) and, in formula (b1),

R²⁵ represents a hydrogen atom,

R²⁶ represents a hydrogen atom, a halogen atom, or C₁₋₄ alkyl,

R²⁷ represents a hydrogen atom, a halogen atom, C₁₋₄ alkyl, C₁₋₄ alkoxy, or C₁₋₄ alkylthio, and

R²⁶ and R²⁷ may combine with a carbon atom attached thereto to form an unsaturated six-membered carbocyclic or heterocyclic group.

24. The compound according to claim 22, wherein

A represents a group of formula (b1) and, in formula (b1),

R²⁵ represents a hydrogen atom,

R²⁶ represents a hydrogen atom, a halogen atom, or C₁₋₄ alkyl,

R²⁷ represents a hydrogen atom, a halogen atom, C₁₋₄ alkyl, C₁₋₄ alkoxy, or C₁₋₄ alkylthio,

R²⁶ and R²⁷ may combine with a carbon atom attached thereto to form an unsaturated six-membered carbocyclic or heterocyclic group, and

R²⁸ represents a saturated or unsaturated four- to seven-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by hydroxyl; cyano; a halogen atom; C₁₋₄ alkoxy; phenyloxy; C₁₋₄ alkylcarbonyl; amino optionally substituted by C₁₋₄ alkyl or C₁₋₄ alkylcarbonyl; aminocarbonyl optionally substituted by C₁₋₄ alkyl; or C₁₋₄ alkyl optionally substituted by hydroxyl or a halogen atom.

25. The compound according to claim 22, wherein A represents a group of formula (b2) and, in formula (b2),

R²⁹ represents a hydrogen atom,

R³⁰ represents a hydrogen atom or C₁₋₄ alkyl, and

R³¹ and R³² combine with carbon atom attached thereto to form an unsaturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by a halogen atom or C₁₋₄ alkyl.

26. The compound according to claim 22, wherein A represents a group of formula (b3) and, in formula (b3),

R³³ and R³⁴ represent a hydrogen atom, and

R³⁵ and R³⁶ combine with a carbon atom attached thereto to form an unsaturated five- or six-membered carbocyclic or heterocyclic group.

27. The compound according to claim 22, wherein when one of R¹ and R² is selected from C₁₋₆ alkyl, and the other substituent is selected from the group consisting of

a hydrogen atom,

benzyl,

groups of formulae (i), (v), and (vi) according to claim 3, and

groups of formulae (ii-a), (iii-a), and (iv-a) according to claim 5,

A is selected from groups of formula (a1) or (b1).

28. The compound according to any one of claims 1 to 8, wherein A represents a group of formula (c) and, in formula (c),

R²¹ and R²², or R²² and R²³ combine with a carbon atom attached thereto to form a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by a halogen atom, C₁₋₄ alkyl, C₁₋₄ alkylcarbonyl, C₁₋₆ alkoxycarbonyl, or an oxygen atom and may condense with another saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group to form, together with the six-membered carbocyclic ring in formula (c), a tricyclic group, and

any one of or both R²⁰ and R²⁴ is selected from groups other than a hydrogen atom.

29. The compound according to claim 1 or pharmaceutically acceptable salt or solvate thereof, wherein formula (I) is represented by formula (100):

wherein

X represents CH or N,

Z represents -O-, -NH-, -S-, or -C(=O)-,

R¹⁰¹ and R¹⁰², which may be the same or different, represent any group selected from the group consisting of a hydrogen atom,

C₁₋₆ alkyl,

benzyl, and

groups of formulae (i), (ii-a), (iii-a), (iv-a), (v), and (vi),

(i) a group of formula (i):

wherein

R⁵¹ and R⁵², which may be the same or different, represent

a hydrogen atom, or

C₁₋₈ alkyl optionally substituted by hydroxyl, an oxygen atom, amino, or a nitrogen atom,

R⁵¹ and R⁵² may combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or six-membered heterocyclic group which may further comprise one or more heteroatoms and in which the heterocyclic group is optionally substituted by C₁₋₄ alkyl, optionally substituted by hydroxyl, hydroxyl, an oxygen atom, aminocarbonyl, C₁₋₄ alkoxy, C₁₋₄ alkoxycarbonyl, or a saturated or unsaturated five- or six-membered heterocyclic group, and the heterocyclic group optionally formed by allowing R⁵¹ to combine with R⁵² may condense with another saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group to form a bicyclic group,

p is an integer of 2 to 4, and

the alkyl chain part in this group is optionally substituted by hydroxyl, or -OR^e group wherein R^e represents C₁₋₄ alkyl or C₁₋₄ alkylcarbonyl,

(ii) a group of formula (ii-a):

(iii) a group of formula (iii-a):

wherein r1 represents an integer of 2 to 4,

(iv) a group of formula (iv-a):

wherein

R⁵³ and R⁵⁴, which may be the same or different, represent
a hydrogen atom, or

C₁₋₆ alkyl optionally substituted by hydroxyl, and

R⁵³ and R⁵⁴ may combine with a nitrogen atom attached thereto to form a saturated or unsaturated five-
or six-membered heterocyclic group which may further comprise one or more heteroatoms and in which the
heterocyclic group is optionally substituted by C₁₋₄ alkyl, optionally substituted by hydroxyl, or a saturated or
unsaturated five- or six-membered heterocyclic group, and the heterocyclic group optionally formed by allowing
R⁵³ to combine with R⁵⁴ may condense with another saturated or unsaturated five- or six-membered carbo-
cyclic or heterocyclic group to form a bicyclic group,

(v) a group of formula (v):

wherein

R⁵⁵ represents C₁₋₄ alkyl and

t is an integer of 0 (zero) to 3, and

(vi) a group of formula (vi):

wherein

R⁵⁶, R⁵⁷ and R⁵⁸, which may be the same or different, represent
a hydrogen atom,

C₁₋₄ alkoxycarbonyl, or

C₁₋₄ alkyl optionally substituted by hydroxyl or a halogen atom, and
u is an integer of 0 (zero) to 4,

R¹⁰³, R¹⁰⁴ and R¹⁰⁶, which may be the same or different, represent

a hydrogen atom,
 a halogen atom,
 C₁₋₆ alkyl,
 C₁₋₁₀ alkoxy optionally substituted by a halogen atom or phenyl,
 C₂₋₆ alkenylcarbonyloxy,
 C₁₋₄ alkylcarbonyl, or
 phenyl optionally substituted by a halogen atom,
 R¹⁰⁵ represents
 hydroxyl,
 a halogen atom,
 C₁₋₆ alkyl,
 C₁₋₁₀ alkoxy optionally substituted by a halogen atom or phenyl,
 C₂₋₆ alkenylcarbonyloxy,
 C₁₋₄ alkylcarbonyl,
 C₁₋₄ alkylthio, or
 phenyl optionally substituted by a halogen atom,
 R¹⁰³ and R¹⁰⁴, R¹⁰⁴ and R¹⁰⁵, and R¹⁰⁵ and R¹⁰⁶ each may combine with a carbon atom attached thereto
 to form a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group,
 R¹⁰⁷ represents
 a hydrogen atom,
 C₁₋₄ alkyl, or
 phenyl optionally substituted by hydroxyl, C₁₋₄ alkyl, or C₁₋₄ alkoxy.

30. The compound according to claim 29, wherein

Z represents -O-,
 at least one of R¹⁰¹ and R¹⁰² represents methyl, and
 R¹⁰⁷ represents a hydrogen atom, methyl, ethyl, or phenyl optionally substituted by hydroxyl, C₁₋₄ alkyl or
 C₁₋₄ alkoxy.

31. The compound according to claim 1 or pharmaceutically acceptable salt or solvate thereof, wherein formula (I) is
 represented by formula (200):

wherein

X represents CH or N,
 Z represents -O-, -NH-, -S-, or -C(=O)-,
 R²⁰¹ and R²⁰², which may be the same or different, represent any group selected from the group consisting of
 a hydrogen atom,
 C₁₋₆ alkyl,
 benzyl, and
 groups of formulae (i), (ii-a), (iii-a), (iv-a), (v), and (vi),

(i) a group of formula (i):

10 wherein

R⁵¹ and R⁵², which may be the same or different, represent

a hydrogen atom, or

C₁₋₈ alkyl optionally substituted by hydroxyl, an oxygen atom, amino, or a nitrogen atom,

15 R⁵¹ and R⁵² may combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or six-membered heterocyclic group which may further comprise one or more heteroatoms and in which the heterocyclic group is optionally substituted by C₁₋₄ alkyl, optionally substituted by hydroxyl, hydroxyl, an oxygen atom, aminocarbonyl, C₁₋₄ alkoxy, C₁₋₄ alkoxy carbonyl, or a saturated or unsaturated five- or six-membered heterocyclic group, and the heterocyclic group optionally formed by allowing R⁵¹ to combine with R⁵² may condense with another saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group to form a bicyclic group,

20 p is an integer of 2 to 4, and

the alkyl chain part in this group is optionally substituted by hydroxyl, or -OR^e group wherein R^e represents C₁₋₄ alkyl or C₁₋₄ alkylcarbonyl,

(ii) a group of formula (ii-a):

30 (iii) a group of formula (iii-a):

40 wherein r1 represents an integer of 2 to 4,

(iv) a group of formula (iv-a):

50 wherein

R⁵³ and R⁵⁴, which may be the same or different, represent

a hydrogen atom, or

C₁₋₆ alkyl optionally substituted by hydroxyl, and

55 R⁵³ and R⁵⁴ may combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or six-membered heterocyclic group which may further comprise one or more heteroatoms and in which the heterocyclic group is optionally substituted by C₁₋₄ alkyl, optionally substituted by hydroxyl, or a saturated or unsaturated five- or six-membered heterocyclic group, and the heterocyclic group optionally formed by allowing R⁵³ to combine with R⁵⁴ may condense with another saturated or unsaturated five- or six-membered carbo-

cyclic or heterocyclic group to form a bicyclic group,
(v) a group of formula (v):

wherein

R^{55} represents C_{1-4} alkyl and

t is an integer of 0 (zero) to 3, and

(vi) a group of formula (vi):

wherein

R^{56} , R^{57} and R^{58} , which may be the same or different, represent

a hydrogen atom,

C_{1-4} alkoxy, carbonyl, or

C_{1-4} alkyl optionally substituted by hydroxyl or a halogen atom, and

u is an integer of 0 (zero) to 4,

R^{203} to R^{206} , which may be the same or different, represent

a hydrogen atom,

hydroxyl,

a halogen atom,

C_{1-6} alkyl,

C_{1-10} alkoxy optionally substituted by a halogen atom or phenyl,

C_{2-6} alkenyl, carbonyloxy,

C_{1-4} alkyl, carbonyl,

C_{1-4} alkylthio, or

phenyl optionally substituted by a halogen atom,

R^{203} and R^{204} , R^{204} and R^{205} , and R^{205} and R^{206} each may combine with a carbon atom attached thereto to form a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group,

provided that at least one of R^{203} to R^{206} is selected from a group other than a hydrogen atom, and

R^{208} represents unsubstituted C_{1-8} alkyl; C_{1-4} alkyl substituted by phenyl; C_{2-8} alkenyl; or phenyl optionally substituted by a halogen atom.

32. The compound according to claim 31, wherein

Z represents $-\text{O}-$, $\text{S}-$, or $-\text{C}(=\text{O})-$, and

R^{208} represents unsubstituted C_{1-8} alkyl; methyl substituted by phenyl; C_{2-8} alkenyl; or phenyl.

33. The compound according to claim 1 or pharmaceutically acceptable salt or solvate thereof, wherein formula (I) is represented by formula (300):

wherein

X represents CH or N,

Z represents -O-, -NH-, -S-, or -C(=O)-,

R³⁰¹ and R³⁰², which may be the same or different, represent any group selected from the group consisting of a hydrogen atom,

C₁₋₆ alkyl,

benzyl, and

groups of formulae (i), (ii-a), (iii-a), (iv-a), (v), and (vi),

(i) a group of formula (i):

wherein

R⁵¹ and R⁵², which may be the same or different, represent a hydrogen atom, or

C₁₋₈ alkyl optionally substituted by hydroxyl, an oxygen atom, amino, or a nitrogen atom,

R⁵¹ and R⁵² may combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or six-membered heterocyclic group which may further comprise one or more heteroatoms and in which the heterocyclic group is optionally substituted by C₁₋₄ alkyl, optionally substituted by hydroxyl, hydroxyl, an oxygen atom, aminocarbonyl, C₁₋₄ alkoxy, C₁₋₄ alkoxy carbonyl, or a saturated or unsaturated five- or six-membered heterocyclic group, and the heterocyclic group optionally formed by allowing R⁵¹ to combine with R⁵² may condense with another saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group to form a bicyclic group,

p is an integer of 2 to 4, and

the alkyl chain part in this group is optionally substituted by hydroxyl, or -OR^e group wherein R^e represents C₁₋₄ alkyl or C₁₋₄ alkylcarbonyl,

(ii) a group of formula (ii-a):

(iii) a group of formula (iii-a):

wherein r_1 represents an integer of 2 to 4,
 (iv) a group of formula (iv-a):

wherein

R^{53} and R^{54} , which may be the same or different, represent
 a hydrogen atom, or

C_{1-6} alkyl optionally substituted by hydroxyl, and

R^{53} and R^{54} may combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or six-membered heterocyclic group which may further comprise one or more heteroatoms and in which the heterocyclic group is optionally substituted by C_{1-4} alkyl, optionally substituted by hydroxyl, or a saturated or unsaturated five- or six-membered heterocyclic group, and the heterocyclic group optionally formed by allowing R^{53} to combine with R^{54} may condense with another saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group to form a bicyclic group,
 (v) a group of formula (v):

wherein

R^{55} represents C_{1-4} alkyl and

t is an integer of 0 (zero) to 3, and

(vi) a group of formula (vi):

wherein

R^{56} , R^{57} and R^{58} , which may be the same or different, represent
 a hydrogen atom,

C_{1-4} alkoxycarbonyl, or

C_{1-4} alkyl optionally substituted by hydroxyl or a halogen atom, and

u is an integer of 0 (zero) to 4,

R^{303} to R^{306} , which may be the same or different, represent

a hydrogen atom,

hydroxyl,

a halogen atom,
 C₁₋₆ alkyl,
 C₁₋₁₀ alkoxy optionally substituted by a halogen atom or phenyl,
 C₂₋₆ alkenylcarbonyloxy,
 C₁₋₄ alkylcarbonyl,
 C₁₋₄ alkylthio, or
 phenyl optionally substituted by a halogen atom,
 R³⁰³ and R³⁰⁴, R³⁰⁴ and R³⁰⁵, and R³⁰⁵ and R³⁰⁶ each may combine with a carbon atom attached thereto
 to form a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group,
 provided that at least one of R³⁰³ to R³⁰⁶ is selected from a group other than a hydrogen atom, and
 at least one of R³⁰⁹ and R³¹⁰ represents a hydrogen atom and the other substituent represents
 a hydrogen atom,
 C₁₋₆ alkyl,
 a saturated or unsaturated five- or six-membered carbocyclic group in which the carbocyclic group is option-
 ally substituted by a halogen atom, or
 naphthyl optionally substituted by a halogen atom, or
 R³⁰⁹ and R³¹⁰ combine with a nitrogen atom attached thereto to form a saturated five- or six-membered
 heterocyclic group which may further comprise one or more heteroatoms.

34. The compound according to claim 33, wherein

Z represents -O-,
 at least one of R³⁰⁹ and R³¹⁰ represents a hydrogen atom and
 the other substituent represents a hydrogen atom, C₁₋₄ alkyl, a saturated or unsaturated six-membered car-
 bocyclic group in which the carbocyclic group is optionally substituted by a halogen atom, or naphthyl, or
 R³⁰⁹ and R³¹⁰ combine with a nitrogen atom attached thereto to form a saturated six-membered heterocyclic
 group which may further comprise one or more heteroatoms.

35. The compound according to claim 1 or pharmaceutically acceptable salt or solvate thereof, wherein formula (I) is
 represented by formula (400):

wherein

X represents CH or N,
 Z represents -O-, -NH-, -S-, or -C(=O)-,
 R⁴⁰¹ and R⁴⁰², which may be the same or different, represent any group selected from C₁₋₆ alkyl,
 R⁴⁰³, R⁴⁰⁴, and R⁴⁰⁶ represent a hydrogen atom, hydroxyl, or a halogen atom,
 R⁴⁰⁵ represents C₁₋₄ alkyl,
 R⁴¹¹ and R⁴¹² combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or six-
 membered heterocyclic group in which the heterocyclic group may further comprise one or more heteroatoms and
 is optionally substituted by C₁₋₄ alkyl optionally substituted by hydroxyl; or a saturated five- or six-membered het-
 erocyclic group.

36. The compound according to claim 35, wherein

Z represents -O-,

R⁴⁰¹ and R⁴⁰² represent methyl,
 R⁴¹¹ and R⁴¹² combine with a nitrogen atom attached thereto to form a saturated five- or six-membered heterocyclic group in which the heterocyclic group may further comprise one or more heteroatoms.

37. The compound according to claim 1 or pharmaceutically acceptable salt or solvate thereof, wherein formula (I) is represented by formula (500):

wherein

- X represents CH or N,
 Z represents -O-, -NH-, -S-, or -C(=O)-,
 R⁵⁰¹ and R⁵⁰², which may be the same or different, represent any group selected from C₁₋₆ alkyl,
 R⁵⁰³ and R⁵⁰⁶ represent a hydrogen atom,
 R⁵⁰⁴ and R⁵⁰⁵ represent C₁₋₆ alkyl, and
 R⁵¹³ represents C₁₋₄ alkyl, and
 R⁵¹⁴ represents hydroxyl; C₁₋₄ alkoxy optionally substituted by phenyl; C₂₋₆ alkenyloxy; phenyloxy; or amino optionally substituted by a six-membered unsaturated heterocyclic group.

38. The compound according to claim 37, wherein

Z represents -O-,
 R⁵⁰¹ and R⁵⁰² represent methyl,
 R⁵⁰³ and R⁵⁰⁶ represent a hydrogen atom,
 R⁵⁰⁴ and R⁵⁰⁵ represent methyl, and
 R⁵¹³ represents methyl.

39. The compound according to claim 1 or pharmaceutically acceptable salt or solvate thereof, wherein formula (I) is represented by formula (600):

wherein

X represents CH or N,

Z represents -O-, -NH-, -S-, or -C(=O)-,

R⁶⁰¹ and R⁶⁰², which may be the same or different, represent any group selected from the group consisting of

a hydrogen atom,

C₁₋₆ alkyl,

benzyl, and

groups of formulae (i), (ii-a), (iii-a), (iv-a), (v), and (vi),

(i) a group of formula (i):

wherein

R⁵¹ and R⁵², which may be the same or different, represent
a hydrogen atom, or

C₁₋₈ alkyl optionally substituted by hydroxyl, an oxygen atom, amino, or a nitrogen atom,

R⁵¹ and R⁵² may combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or six-membered heterocyclic group which may further comprise one or more heteroatoms and in which the heterocyclic group is optionally substituted by C₁₋₄ alkyl, optionally substituted by hydroxyl, hydroxyl, an oxygen atom, aminocarbonyl, C₁₋₄ alkoxy, C₁₋₄ alkoxy carbonyl, or a saturated or unsaturated five- or six-membered heterocyclic group, and the heterocyclic group optionally formed by allowing R⁵¹ to combine with R⁵² may condense with another saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group to form a bicyclic group,

p is an integer of 2 to 4, and

the alkyl chain part in this group is optionally substituted by hydroxyl, or -OR^e group wherein R^e represents C₁₋₄ alkyl or C₁₋₄ alkylcarbonyl,

(ii) a group of formula (ii-a):

(iii) a group of formula (iii-a):

wherein r1 represents an integer of 2 to 4,

(iv) a group of formula (iv-a):

wherein

R^{53} and R^{54} , which may be the same or different, represent

a hydrogen atom, or

C_{1-6} alkyl optionally substituted by hydroxyl, and

R^{53} and R^{54} may combine with a nitrogen atom attached thereto to form a saturated or unsaturated five- or six-membered heterocyclic group which may further comprise one or more heteroatoms and in which the heterocyclic group is optionally substituted by C_{1-4} alkyl, optionally substituted by hydroxyl, or a saturated or unsaturated five- or six-membered heterocyclic group, and the heterocyclic group optionally formed by allowing R^{53} to combine with R^{54} may condense with another saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group to form a bicyclic group,
(v) a group of formula (v):

wherein

R^{55} represents C_{1-4} alkyl and

t is an integer of 0 (zero) to 3, and

(vi) a group of formula (vi):

wherein

R^{56} , R^{57} and R^{58} , which may be the same or different, represent

a hydrogen atom,

C_{1-4} alkoxy, or

C_{1-4} alkyl optionally substituted by hydroxyl or a halogen atom, and

u is an integer of 0 (zero) to 4,

R^{625} represents a hydrogen atom,

R^{626} represents a hydrogen atom, a halogen atom, or C_{1-4} alkyl,

R^{627} represents a hydrogen atom, a halogen atom, C_{1-4} alkyl, C_{1-4} alkoxy, or C_{1-4} alkylthio,

R^{626} and R^{627} may combine with a carbon atom attached thereto to form an unsaturated six-membered carbocyclic or heterocyclic group,

R^{628} represents

a hydrogen atom,

a halogen atom,

nitro,

cyano,

C_{1-6} alkyl in which the alkyl group is optionally substituted by hydroxyl; phenyl; amino optionally substituted by C_{1-4} alkyl; C_{1-4} alkylcarbonyloxy; or a saturated or unsaturated six-membered heterocyclic group optionally substituted by C_{1-4} alkyl,

C_{1-8} alkoxy,

C_{1-4} alkylcarbonyl,

C_{2-6} alkenyl optionally substituted by a saturated or unsaturated six-membered carbocyclic group,

C_{2-6} alkynyl optionally substituted by C_{1-2} alkylsilyl,

a saturated or unsaturated three- to eight-membered carbocyclic oxy group,

a saturated or unsaturated six-membered carbocyclic carbonyl or heterocyclic carbonyl group optionally substituted by C_{1-4} alkyl, or

a saturated or unsaturated three- to eight-membered carbocyclic or heterocyclic group in which the carbo-

cyclic or heterocyclic group is optionally substituted by hydroxyl; cyano; a halogen atom; C₁₋₄ alkoxy; phenoxy; C₁₋₄ alkylcarbonyl; amino optionally substituted by C₁₋₄ alkyl or C₁₋₄ alkylcarbonyl; aminocarbonyl optionally substituted by C₁₋₄ alkyl; or C₁₋₄ alkyl optionally substituted by hydroxyl or a halogen atom.

40. The compound according to claim 39, wherein R⁶²⁸ represents a saturated or unsaturated four- to seven-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by hydroxyl; cyano; a halogen atom; C₁₋₄ alkoxy; phenoxy; C₁₋₄ alkylcarbonyl; amino optionally substituted by C₁₋₄ alkyl or C₁₋₄ alkylcarbonyl; aminocarbonyl optionally substituted by C₁₋₄ alkyl; or C₁₋₄ alkyl optionally substituted by hydroxyl or a halogen atom.

41. The compound according to claim 1 or pharmaceutically acceptable salt or solvate thereof, wherein formula (I) is represented by formula (700):

wherein

X represents CH or N,

Z represents -O-, -NH-, -S-, or -C(=O)-,

R⁷⁰¹ and R⁷⁰², which may be the same or different, represent any group selected from C₁₋₆ alkyl,

R⁷²⁹ represents a hydrogen atom,

R⁷³⁰ represents a hydrogen atom or C₁₋₄ alkyl, and

R⁷³¹ and R⁷³² combine with a carbon atom attached thereto to form an unsaturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by a halogen atom or C₁₋₄ alkyl.

42. The compound according to claim 41, wherein

Z represents -O- and

R⁷⁰¹ and R⁷⁰² represent methyl.

43. The compound according to claim 1, represented by formula (800), or a pharmaceutically acceptable salt or solvate thereof:

wherein

X represents CH or N,

Z represents -O-, -NH-, -S-, or -C(=O)-,

R⁸⁰¹ and R⁸⁰², which may be the same or different, represent any group selected from C₁₋₆ alkyl,

R⁸³³ and R⁸³⁴ represent a hydrogen atom, and

R⁸³⁵ and R⁸³⁶ combine with a carbon atom attached thereto to form an unsaturated five- or six-membered carbocyclic or heterocyclic group.

44. The compound according to claim 43, wherein

Z represents -O- or -S-,

R⁸⁰¹ and R⁸⁰² represent methyl,

R⁸³⁵ and R⁸³⁶ combine with a carbon atom attached thereto to form phenyl.

45. The compound according to claim 1 or pharmaceutically acceptable salt or solvate thereof, wherein formula (I) is represented by formula (900):

wherein

X represents CH or N,

Z represents -O-, -NH-, -S-, or -C(=O)-,

R⁹⁰¹ and R⁹⁰², which may be the same or different, represent any group selected from C₁₋₆ alkyl,

R⁹²⁰, R⁹²¹, R⁹²³, and R⁹²⁴, which may be the same or different, represent

a hydrogen atom,

a halogen atom,

C₁₋₁₀ alkyl optionally substituted by hydroxyl, a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group,

C₁₋₈ alkoxy,

C₂₋₆ alkenyl optionally substituted by C₁₋₄ alkyl, C₁₋₄ alkoxy, an oxygen atom or phenyl,
 phenylcarbonyl optionally substituted by C₁₋₄ alkyl,
 amino optionally substituted by phenyl,
 nitro, or

a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by C₁₋₆ alkyl,
 provided that at least one of R⁹²⁰ and R⁹²⁴ is selected from a group other than a hydrogen atom,
 R⁹²² represents

C₁₋₁₀ alkyl optionally substituted by hydroxyl, a saturated or unsaturated six-membered carbocyclic or heterocyclic group,
 C₁₋₈ alkoxy,
 amino optionally substituted by phenyl,
 nitro, or

a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by C₁₋₆ alkyl, and

R⁹²¹ and R⁹²², or R⁹²² and R⁹²³ may combine with a carbon atom attached thereto to form a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by a halogen atom, C₁₋₄ alkyl, C₁₋₄ alkylcarbonyl, C₁₋₆ alkoxycarbonyl, or an oxygen atom, and the carbocyclic or heterocyclic group may condense with another saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group to form a tricyclic group together with the six-membered carbocyclic ring of formula (c).

46. The compound according to claim 45, wherein

at least one of R⁹²⁰ and R⁹²⁴ is selected from a group other than a hydrogen atom, and

R⁹²¹ and R⁹²², or R⁹²² and R⁹²³ may combine with a carbon atom attached thereto to form a saturated or unsaturated five- or six-membered carbocyclic or heterocyclic group in which the carbocyclic or heterocyclic group is optionally substituted by a halogen atom, C₁₋₄ alkyl, C₁₋₄ alkylcarbonyl, C₁₋₆ alkoxycarbonyl, or an oxygen atom.

47. A pharmaceutical composition comprising as an active ingredient the compound according to any one of claims 1 to 46 or a pharmaceutically acceptable salt or solvate thereof.

48. The pharmaceutical composition according to claim 47, for the therapy or prophylaxis of a disease for which TGFβ inhibition is effective therapeutically or prophylactically.

49. The pharmaceutical composition according to claim 48, wherein the disease for which TGFβ inhibition is effective therapeutically or prophylactically is a disease involving fibrosis of an organ or a tissue.

50. The pharmaceutical composition according to claim 48, wherein the disease for which TGFβ inhibition is effective therapeutically or prophylactically is chronic renal disease, acute renal disease, hepatic fibrosis, cirrhosis, pulmonary fibrosis, scleroderma, wound healing, arthritis, congestive cardiac disease, ulcer, ocular disorder, cornea disorder, diabetic nephropathy, peritoneal sclerosis, arterial sclerosis, peritoneal adhesion, or subdermal adhesion.

51. The pharmaceutical composition according to claim 48, wherein the disease for which TGFβ inhibition is effective therapeutically or prophylactically is a malignant tumor.

52. The pharmaceutical composition according to claim 47, which may be used for in vitro amplification of cells.

53. A TGFβ inhibitor comprising the compound according to any one of claims 1 to 46 or a pharmaceutically acceptable salt or solvate thereof.

54. A method for treating or preventing a disease for which TGFβ inhibition is effective therapeutically or prophylactically, comprising the step of administering a therapeutically or prophylactically effective amount of the compound according to any one of claims 1 to 46 or a pharmaceutically acceptable salt or solvate thereof to a patient who should undergo therapy of a disease for which inhibition activity is effective therapeutically or prophylactically.

55. The method according to claim 54, wherein the disease for which TGFβ inhibition is effective therapeutically or prophylactically is a disease involving fibrosis of an organ or a tissue.

56. The method according to claim 54, wherein the disease for which TGF β inhibition is effective therapeutically or prophylactically is chronic renal disease, acute renal disease, hepatic fibrosis, cirrhosis, pulmonary fibrosis, scleroderma, wound healing, arthritis, congestive cardiac disease, ulcer, ocular disorder, cornea disorder, diabetic nephropathy, peritoneal sclerosis, arterial sclerosis, peritoneal adhesion, or subdermal adhesion.

5

57. The method according to claim 54, wherein the disease for which TGF β inhibition is effective therapeutically or prophylactically is a malignant tumor.

58. A method for amplifying cells in vitro, comprising the step of addition, into target cells in vitro, of the compound according to any one of claims 1 to 46 or a pharmaceutically acceptable salt or solvate thereof in an amount effective for promoting cell amplification to amplify cells.

10

59. The method according to claim 58, wherein said target cells are hematopoietic stem cells.

60. A method for inhibiting the action of TGF β on cells, comprising the step of applying an effective amount of the compound according to any one of claims 1 to 46 to cells present in vitro or in vivo.

15

61. Use of the compound according to any one of claims 1 to 46, for the manufacture of a therapeutic or prophylactic agent for a disease for which TGF β inhibition is effective therapeutically or prophylactically.

20

62. Use of the compound according to any one of claims 1 to 46, for the manufacture of a TGF β inhibitor.

63. Use of the compound according to any one of claims 1 to 46, for the manufacture of an accelerator for in vitro amplification of cells.

PCT/JP03/10647

Box I Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 54-57, 60
because they relate to subject matter not required to be searched by this Authority, namely:
Claims 54-57, 60 pertain to a method for treatment of the human body by surgery or therapy and to a diagnostic method, and thus relate to subject matters for which this International Searching Authority is not required to search.
2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

The chemical structures common to the compounds described in claims 1-46 are known because they are disclosed in the documents shown in Box C, including WO 00/47212 A1 and WO 96/39145 A1. None of the chemical structures can hence be considered to be an important chemical structural element. Consequently, there is no technical relationship among these inventions which involves one or more identical or corresponding special technical features.

In claims 47-53, 58, 59, and 61-63 is cited any of claims 1-46. Consequently, the groups of inventions disclosed in claims 1-53, 58, 59, and 61-63 cannot be considered to be so linked as to form a single general inventive concept.

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☒ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.
